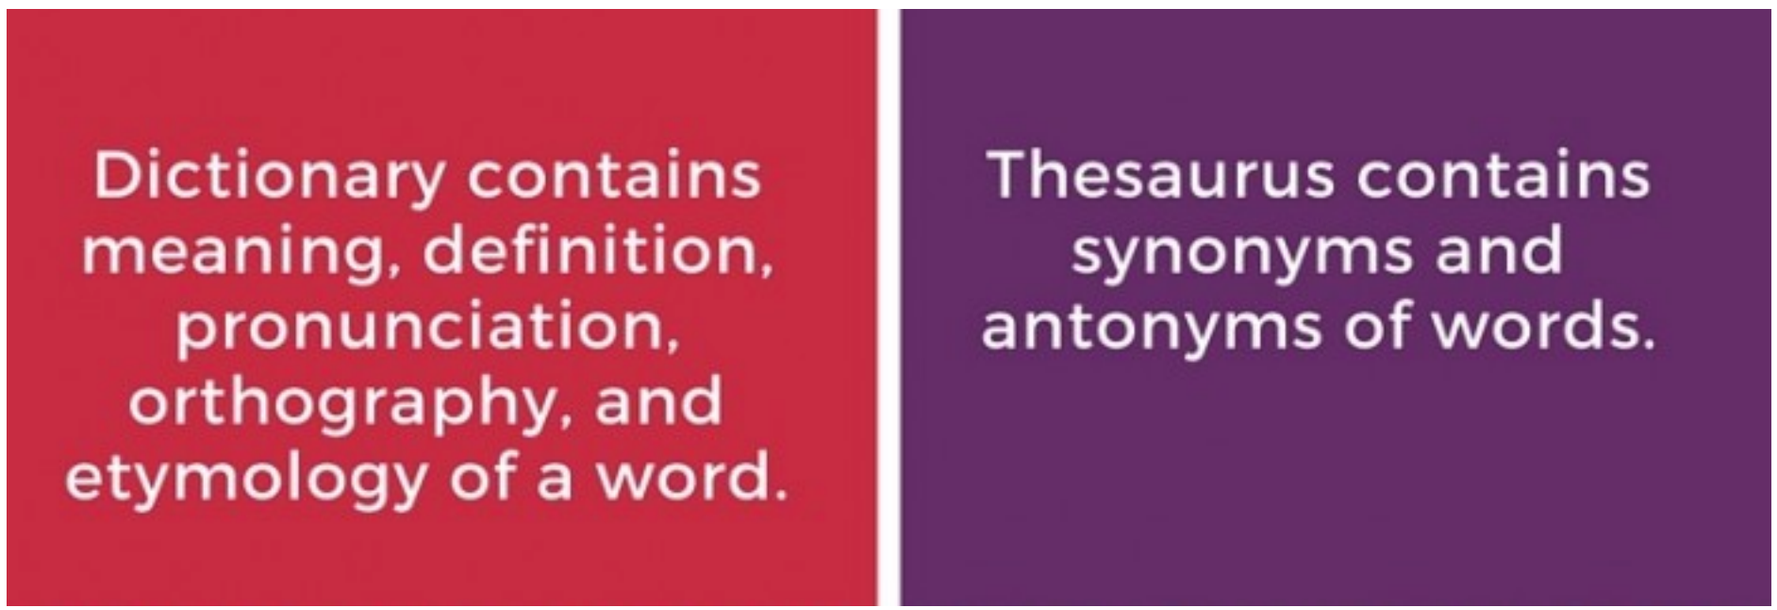
WordNet®

- What is it?
  - a large lexical database of English (155,287 words, latest version in 2005~6)
  - created (from mid-1980s) and maintained by Cognitive Science Lab of Princeton University
  - designed to establish the connections between words

(Miller, Beckwith, Fellbaum, Gross, & Miller 1990; Miller & Fellbaum, 1991; Miller, 1995; Fellbaum, 1998)

WordNet®

- What is it?
  - a combination of dictionary and thesaurus
  - try it out http://wordnet.princeton.edu/
- In other languages: http://globalwordnet.org/wordnets-in-the-world/



WordNet®

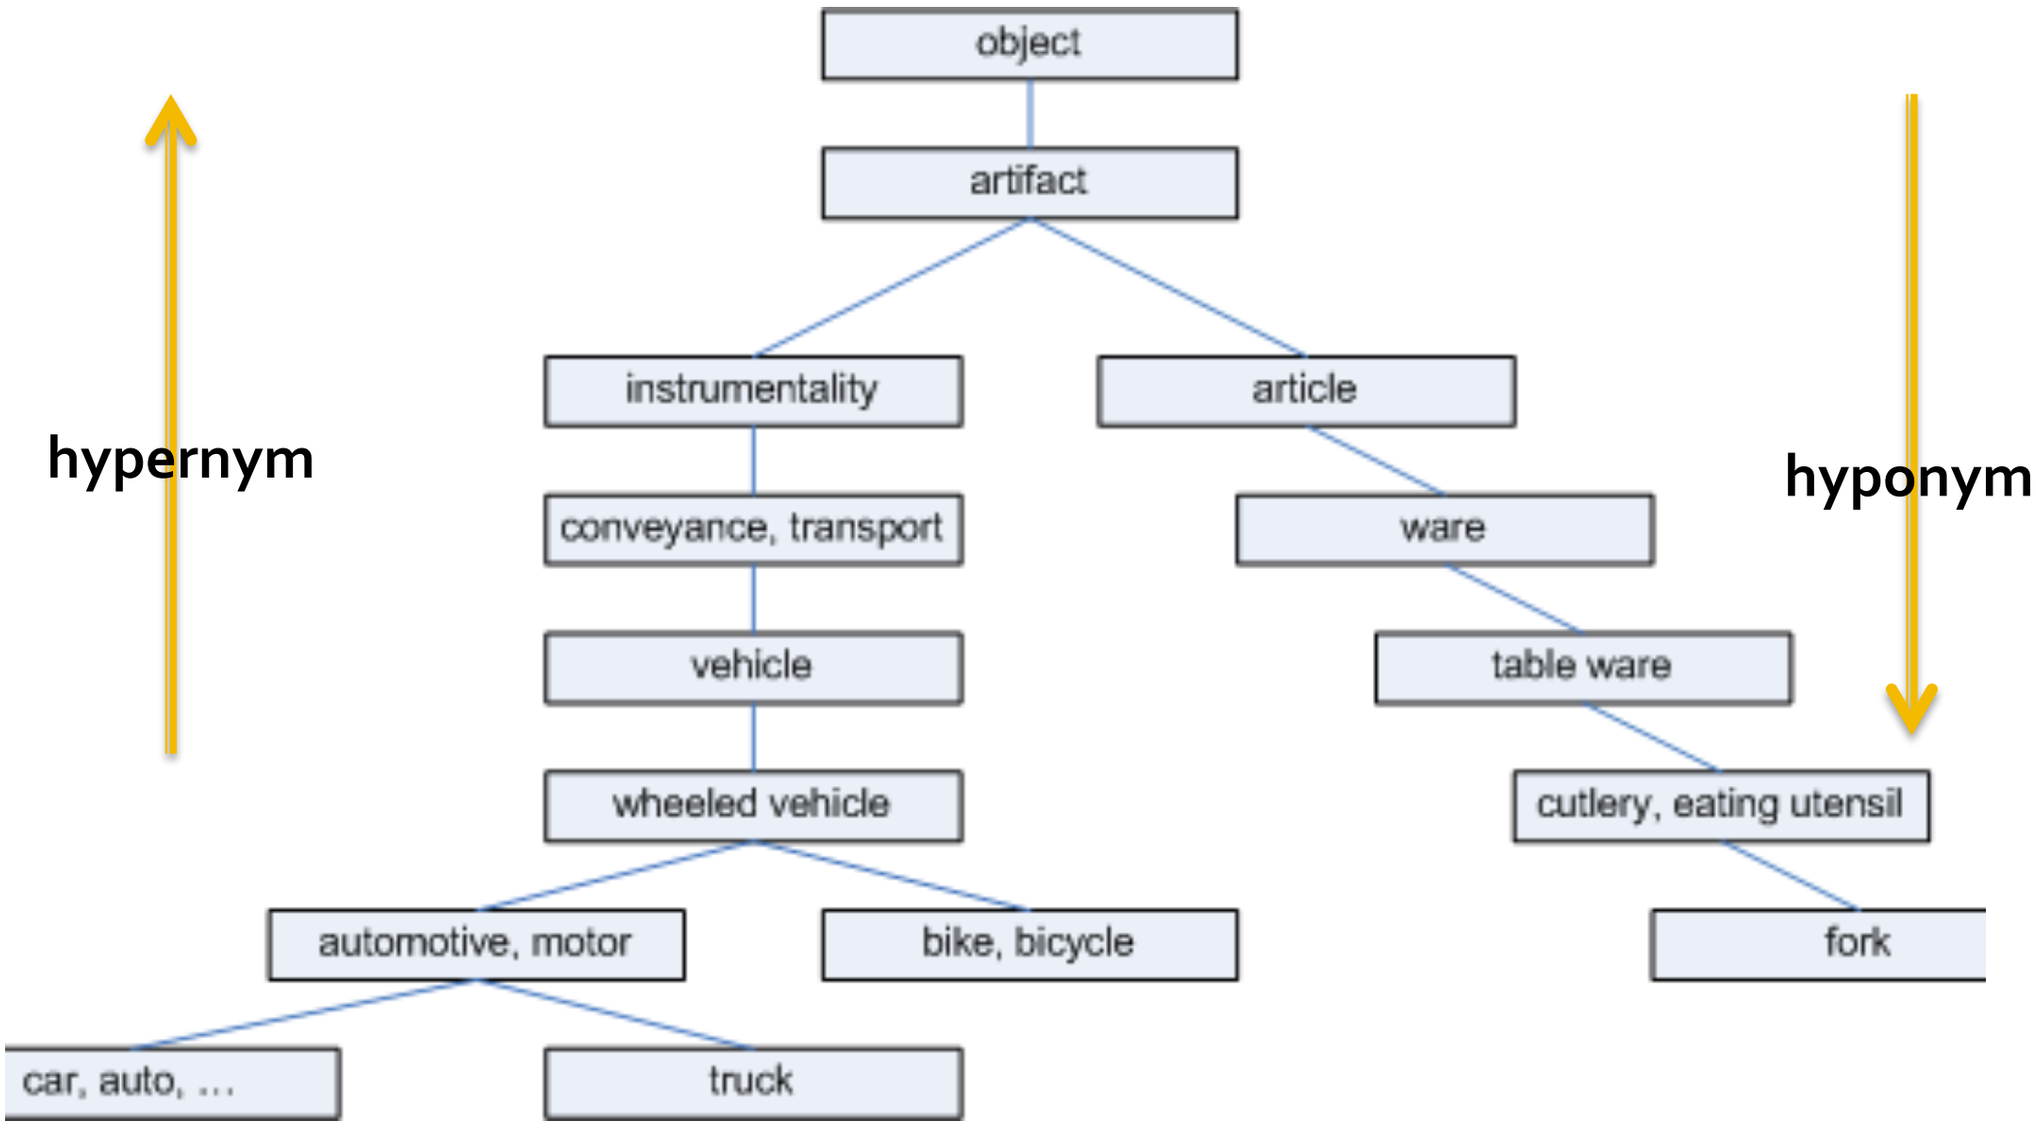
- 4 types of Parts of Speech (POS)
  - Noun, Verb, Adjective, Adverb
- Synset (synonym set)
  - the smallest unit in WordNet
  - represents a specific meaning of a word

- S: (n) **search** (an investigation seeking answers) *"a thorough search of the ledgers revealed nothing"; "the outcome justified the search"*
- S: (v) **search**, seek, look for (try to locate or discover, or try to establish the existence of) *"The police are searching for clues"; "They are searching for the missing man in the entire county"*

WordNet®

- Synsets are connected to one anther through semantic and lexical relations
- Type of relations (based on POS)
  - hypernyms (kind-of): ‘vehicle’ is a hypernym of ‘car’
  - hyponyms (kind-of): ‘car’ is a hyponym of ‘vehicle’
  - holonym (part-of): ‘building’ is a holonym of ‘window’
  - meronym(part-of): ‘window’ is a meronym of ‘building’
  - similar to: ‘smart’ is similar to ‘intelligent’
  - antonyms: ‘smart’ is antonym of ‘unintelligent’

WordNet®



hypernym
hyponym
object
artifact
instrumentality
article
conveyance, transport
ware
vehicle
table ware
wheeled vehicle
cutlery, eating utensil
automotive, motor
bike, bicycle

WordNet: a lexical database for English [PDF] semanticscholar.org
GA Miller - Communications of the ACM, 1995 - dl.acm.org
Abstract Because meaningful sentences are composed of meaningful words, any system that hopes to process natural languages as people do must have information about words and their meanings. This information is traditionally provided through dictionaries, and

ImageNet is an image database organized according to the WordNet hierarchy (currently only the nouns), in which each node of the hierarchy is depicted by hundreds and thousands of images. Currently we have an average of over five hundred images per node. We hope ImageNet will become a useful resource for researchers, educators, students and all of you who share our passion for pictures.

Click here to learn more about ImageNet, Click here to join the ImageNet mailing list.

What do these images have in common? *Find out!*

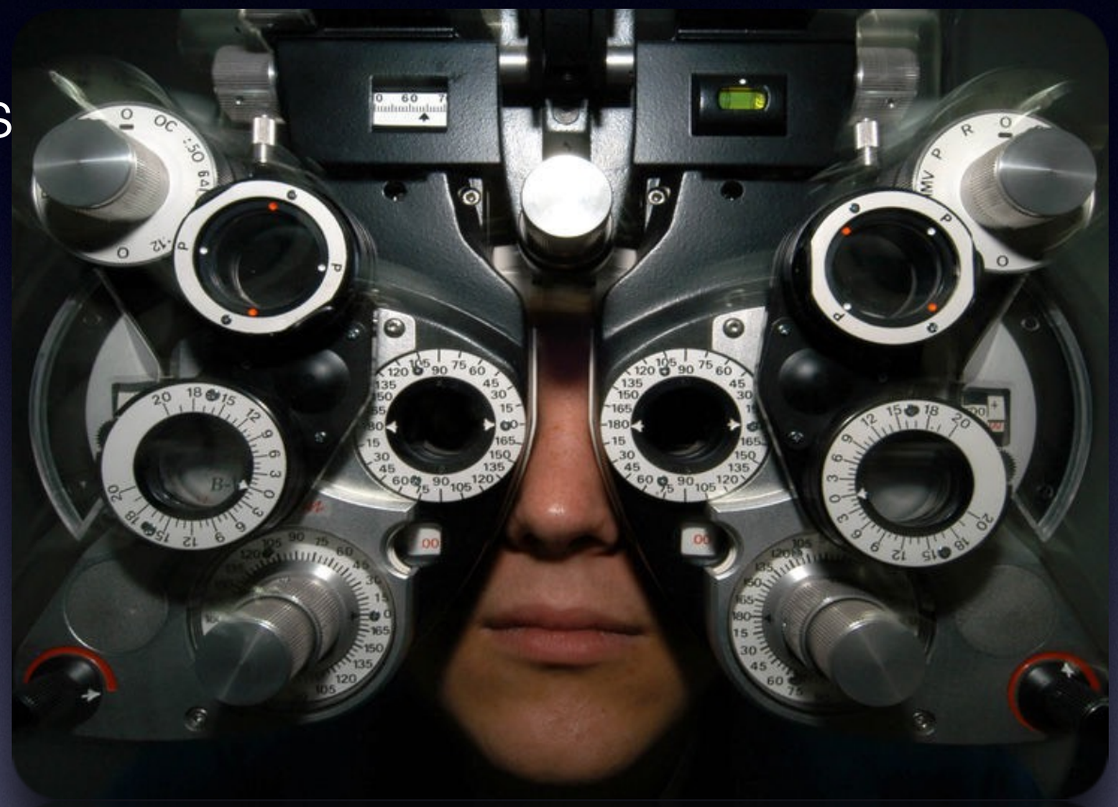
Distributional Hypothesis

If we consider **oculist** and **eye-doctor** we find that, as our corpus of utterances grows, these two occur in almost the same environments. In contrast, there are many sentence environments in which **oculist** occurs but **lawyer** does not...



It is a question of the relative frequency of such environments, and of what we will obtain if we ask an informant to substitute any word he wishes for **oculist** (not asking what words have the same meaning).

These and similar tests all measure the probability of particular environments occurring with particular elements... If A and B have almost identical environments we say that they are synonyms.

–Zellig Harris (1954)

Source: Chris Callison-Burch

DIRT

(Discovery of Inference Rules from Text)

Lin and Panel (2001) operationalize the Distributional Hypothesis using **dependency relationships** to define **similar environments.**

Duty and **responsibility** share a similar set of dependency contexts in large volumes of text:

modified by adjectives	objects of verbs
additional, administrative, assigned, assumed, collective, congressional, constitutional ...	assert, assign, assume, attend to, avoid, become, breach ...

Source: Chris Callison-Burch

Juri Ganitkevitch, Ben Van Durme and Chris Callison-Burch. PPDB: The Paraphrase Database. NAACL 2013.

Pivoting w/ Neural MT

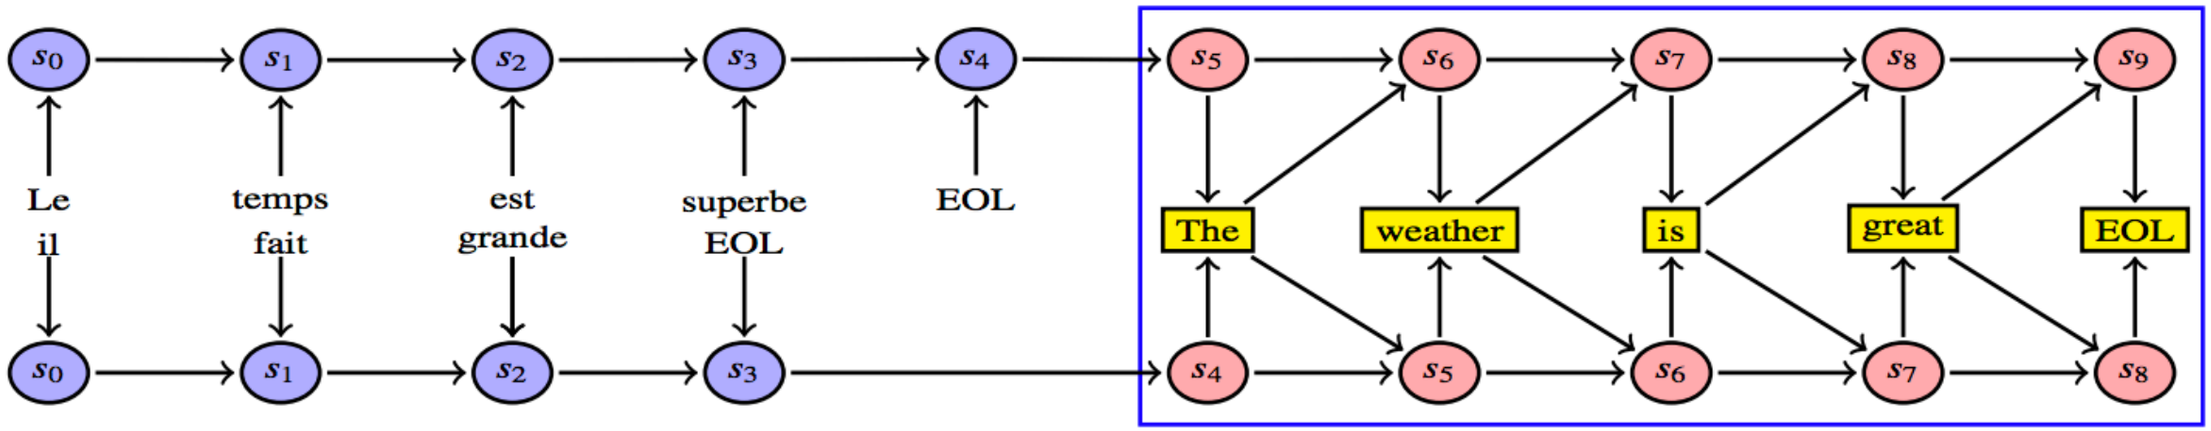

Figure 1: Late-weighted combination: two pivot sentences are simultaneously translated to one target sentence. Blue circles indicate the encoders, which individually encode the two source sentences. After the EOL token is seen, decoding starts (red circles). At each time step the two decoders produce a probability distribution over all words, which are then combined (in the yellow square) using Equation (6). From this combined distribution a word is chosen, which is then given as input to each decoder.

Jonathan Mallinson, Rico Sennrich and Mirella Lapata. Paraphrasing Revisited with Neural Machine Translation. EACL 2017.

Pivoting w/ Neural MT

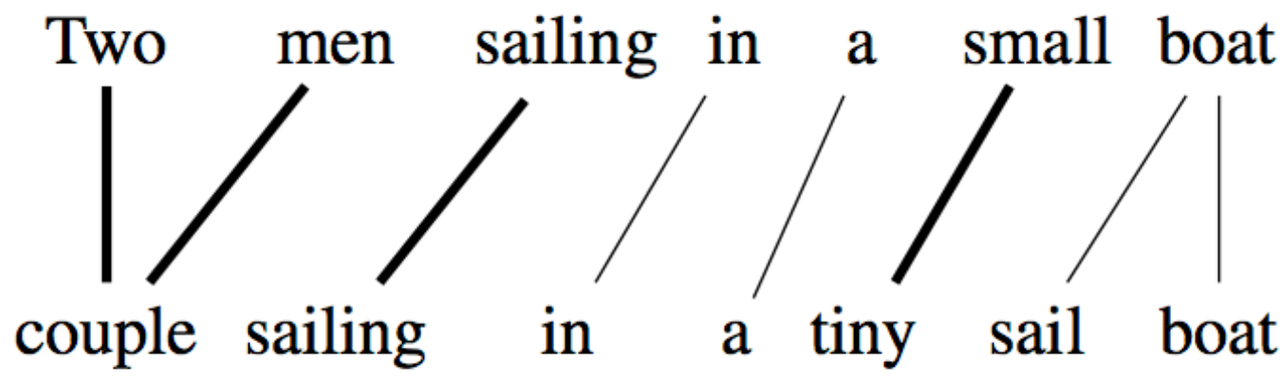

Figure 2: Attention between two sentences. Line thickness indicates the strength of the attention.

$$\alpha(E_2^i, E_1^j, \mathcal{F}) = \sum_{F}^{\mathcal{F}} \left(P(E_2 | E_1, F) \cdot \sum_{m}^{T_F} \left(\alpha_{i,m}^{E_2,F} \cdot \alpha_{m,j}^{F,E_1} \right) \right)$$

Paraphrase pairs list

Source1	Source 2	Score
ذهب	خرج	0.4
ذهب	ذهبت	0.2
ذهب	ذهبوا	0.1
ذهب	الذهب	0.1
ذهب	جولد	0.2
خرج	ترک	0.5
خرج	ذهب	0.4
جولد	ذهب	0.2
جولد	غولد	0.3
...		

Figure 2: A small sample of the real graph constructed from the Arabic PPDB for Arabic to English translation. Filled nodes (1 and 6) are phrases from the SMT phrase table (unfilled nodes are not). Edge weights are set using a log-linear combination of scores from PPDB. Phrase #6 has different senses ('gold' or 'left'); and it has a paraphrase in phrase #7 for the 'gold' sense and a paraphrase in phrase #2 for the 'left' sense. After propagation, phrase #2 receives translation candidates from phrase #6 and phrase #1 reducing the probability of translation from unrelated senses (like the 'gold' sense). Phrase #8 is a misspelling of phrase #7 and is also captured as a paraphrase. Phrase #6 propagates translation candidates to phrase #8 through phrase #7. Morphological variants of phrase #6 (shown in bold) also receive translation candidates through graph propagation giving translation candidates for morphologically rich OOVs.
