Instructor: Wei Xu

Website: socialmedia-class.org

with slides adapted from Andrew Ng

(Recap) Classification Method:

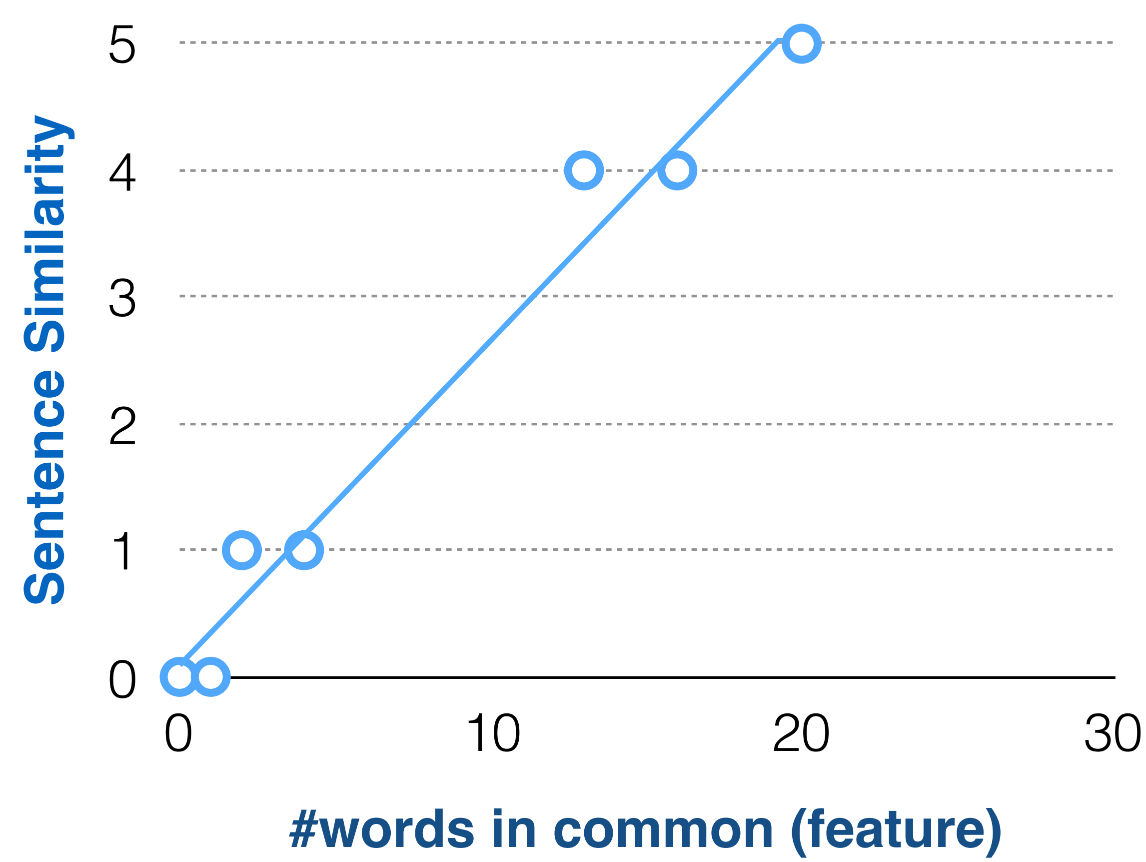
Supervised Machine Learning

- Input:
  - a sentence pair $\boldsymbol{x}$ **(represented by features)**
  - a fixed set of binary classes $\boldsymbol{Y = \{0, 1\}}$
  - a training set of $\boldsymbol{m}$ hand-labeled sentence pairs $\boldsymbol{(x^{(1)}, y^{(1)}), \ldots, (x^{(m)}, y^{(m)})}$

- Output:
  - a learned classifier $\gamma: \boldsymbol{x} \rightarrow \boldsymbol{y} \in \boldsymbol{Y}$ ($\boldsymbol{y = 0}$ or $\boldsymbol{y = 1}$)

(Recap)

Linear Regression



- also supervised learning (learn from annotated data)
- but for **Regression**: predict **real-valued** output
  (Classification: predict discrete-valued output)

(Recap) Linear Regression w/ one variable:

Model Representation

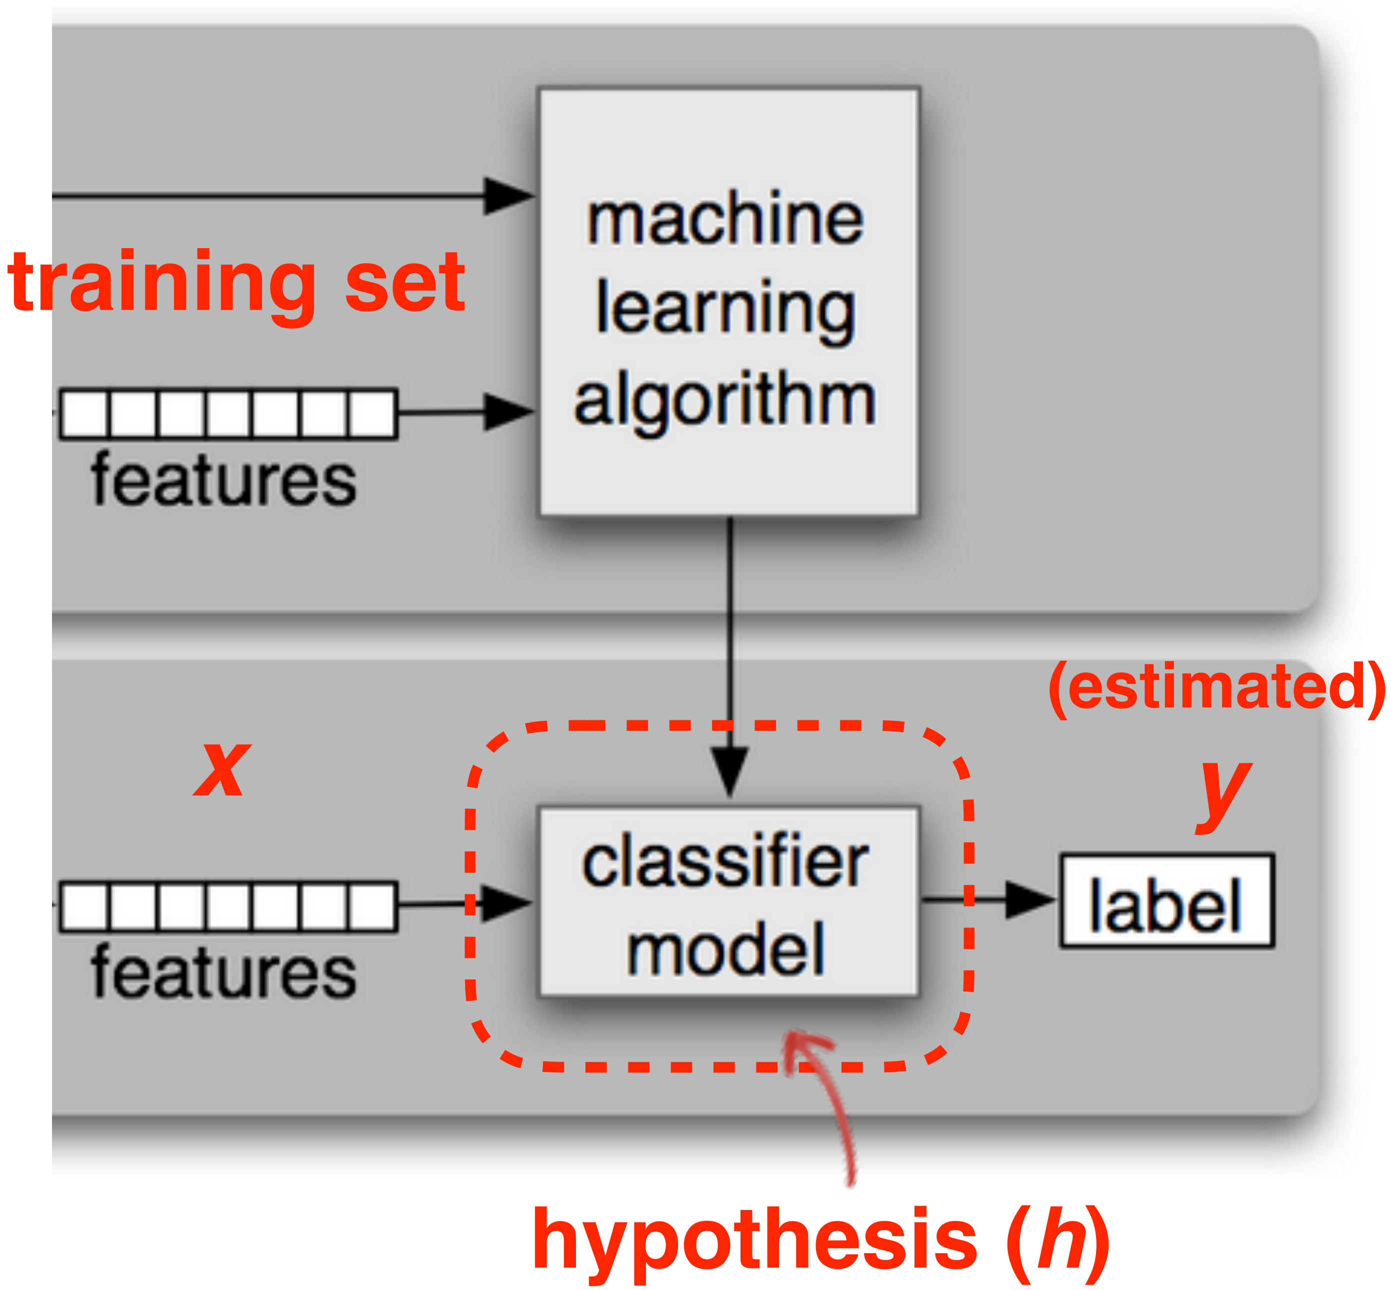
#words in common (x)	**Sentence Similarity (y)**
1	0
4	1
13	4
18	5
…	…

- ***m*** hand-labeled sentence pairs $(x^{(1)}, y^{(1)}), \dots, (x^{(m)}, y^{(m)})$
  θ's: parameters

Source: many following slides are adapted from Andrew Ng

(Recap) Linear Regression:

Model Representation



- How to represent ***h*** ?

$$h_\theta(x) = \theta_0 + \theta_1 x$$

Linear Regression
w/ one variable

(Recap)

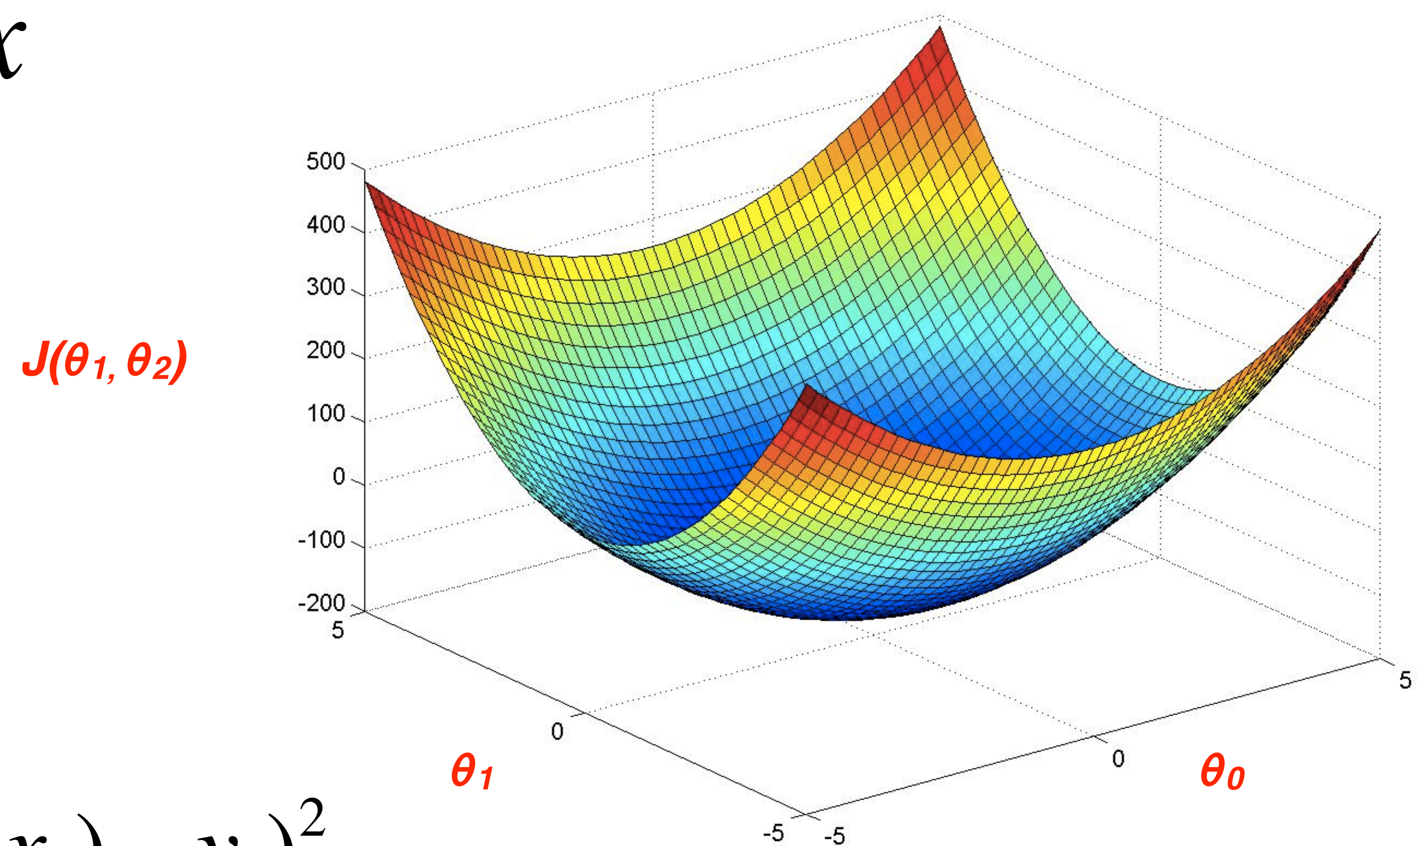
Linear Regression

- **Hypothesis**:

$$h_\theta(x) = \theta_0 + \theta_1 x$$

- **Parameters:**

$\boldsymbol{\theta_0}$, $\boldsymbol{\theta_1}$



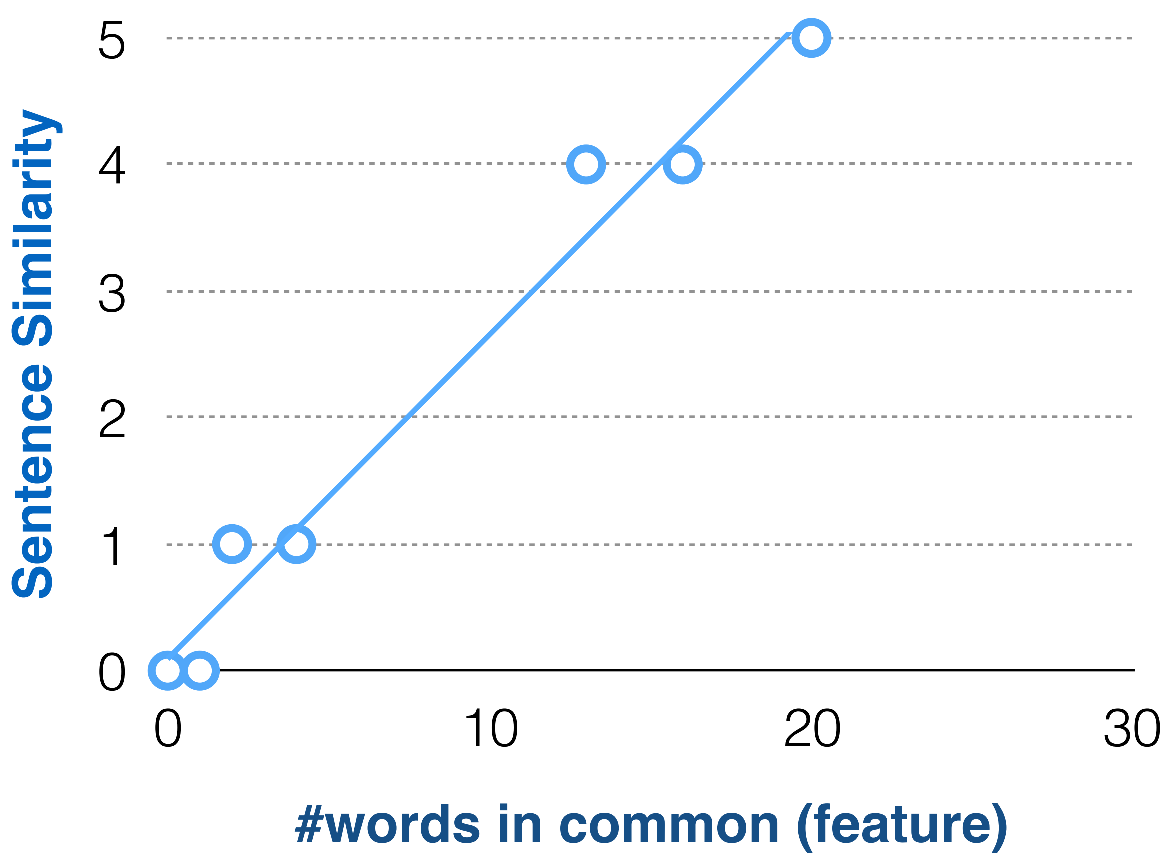
- **Cost Function:**

$$J(\theta_0, \theta_1) = \frac{1}{2m}\sum_{i=1}^{m}(h_\theta(x_i) - y_i)^2$$

- **Goal:** $\underset{\theta_0, \theta_1}{\text{minimize}}\, J(\theta_0, \theta_1)$

(Recap) Linear Regression w/ one variable:

Cost Function



squared error function:

$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} (h_\theta(x_i) - y_i)^2$$

- **Idea:** choose θ_0, θ_1 so that $h_\theta(x)$ is close to y for training examples (x, y)

$$\underset{\theta_0, \theta_1}{\text{minimize}} \, J(\theta_0, \theta_1)$$

(Recap)

Gradient Descent

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

simultaneous update
for j=0 and j=1

}

learning rate

(Recap) Linear Regression w/ one variable:

Gradient Descent

repeat until convergence {

$$\theta_0 := \theta_0 - \alpha \frac{1}{m} \sum_{i=1}^{m} (h_\theta(x_i) - y_i)$$

$$\theta_1 := \theta_1 - \alpha \frac{1}{m} \sum_{i=1}^{m} (h_\theta(x_i) - y_i) \cdot x_i$$

}

simultaneous update ***θ_0***, ***θ_1***

Linear Regression w/ multiple variables (features):

Model Representation

- Hypothesis:

$$h_\theta(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \cdots + \theta_n x_n$$

(for convenience, define $x_0 = 1$)

Linear Regression w/ multiple variables (features):

Model Representation

- Hypothesis:

$$h_\theta(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \cdots + \theta_n x_n$$

(for convenience, define $x_0 = 1$)

$$x = \begin{bmatrix} x_0 \\ x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \in R^{n+1} \quad \theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix} \in R^{n+1}$$

Linear Regression w/ multiple variables (features):

Model Representation

- Hypothesis:

$$h_\theta(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2 + \cdots + \theta_n x_n$$

(for convenience, define $x_0 = 1$)

$$x = \begin{bmatrix} x_0 \\ x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \in R^{n+1} \quad \theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix} \in R^{n+1}$$

$$h_\theta(x) = \theta^T x$$

Linear Regression w/ multiple variables (features):

Model Representation

- Hypothesis:

$$h_\theta(x) = \theta^T x$$

- Cost function: **# training examples**

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^{m} \left(h_\theta(x^{(i)}) - y^{(i)}\right)^2$$

(Recap)

Paraphrase Identification

obtain sentential paraphrases automatically

Linear Regression

A problem in classification

Linear Regression

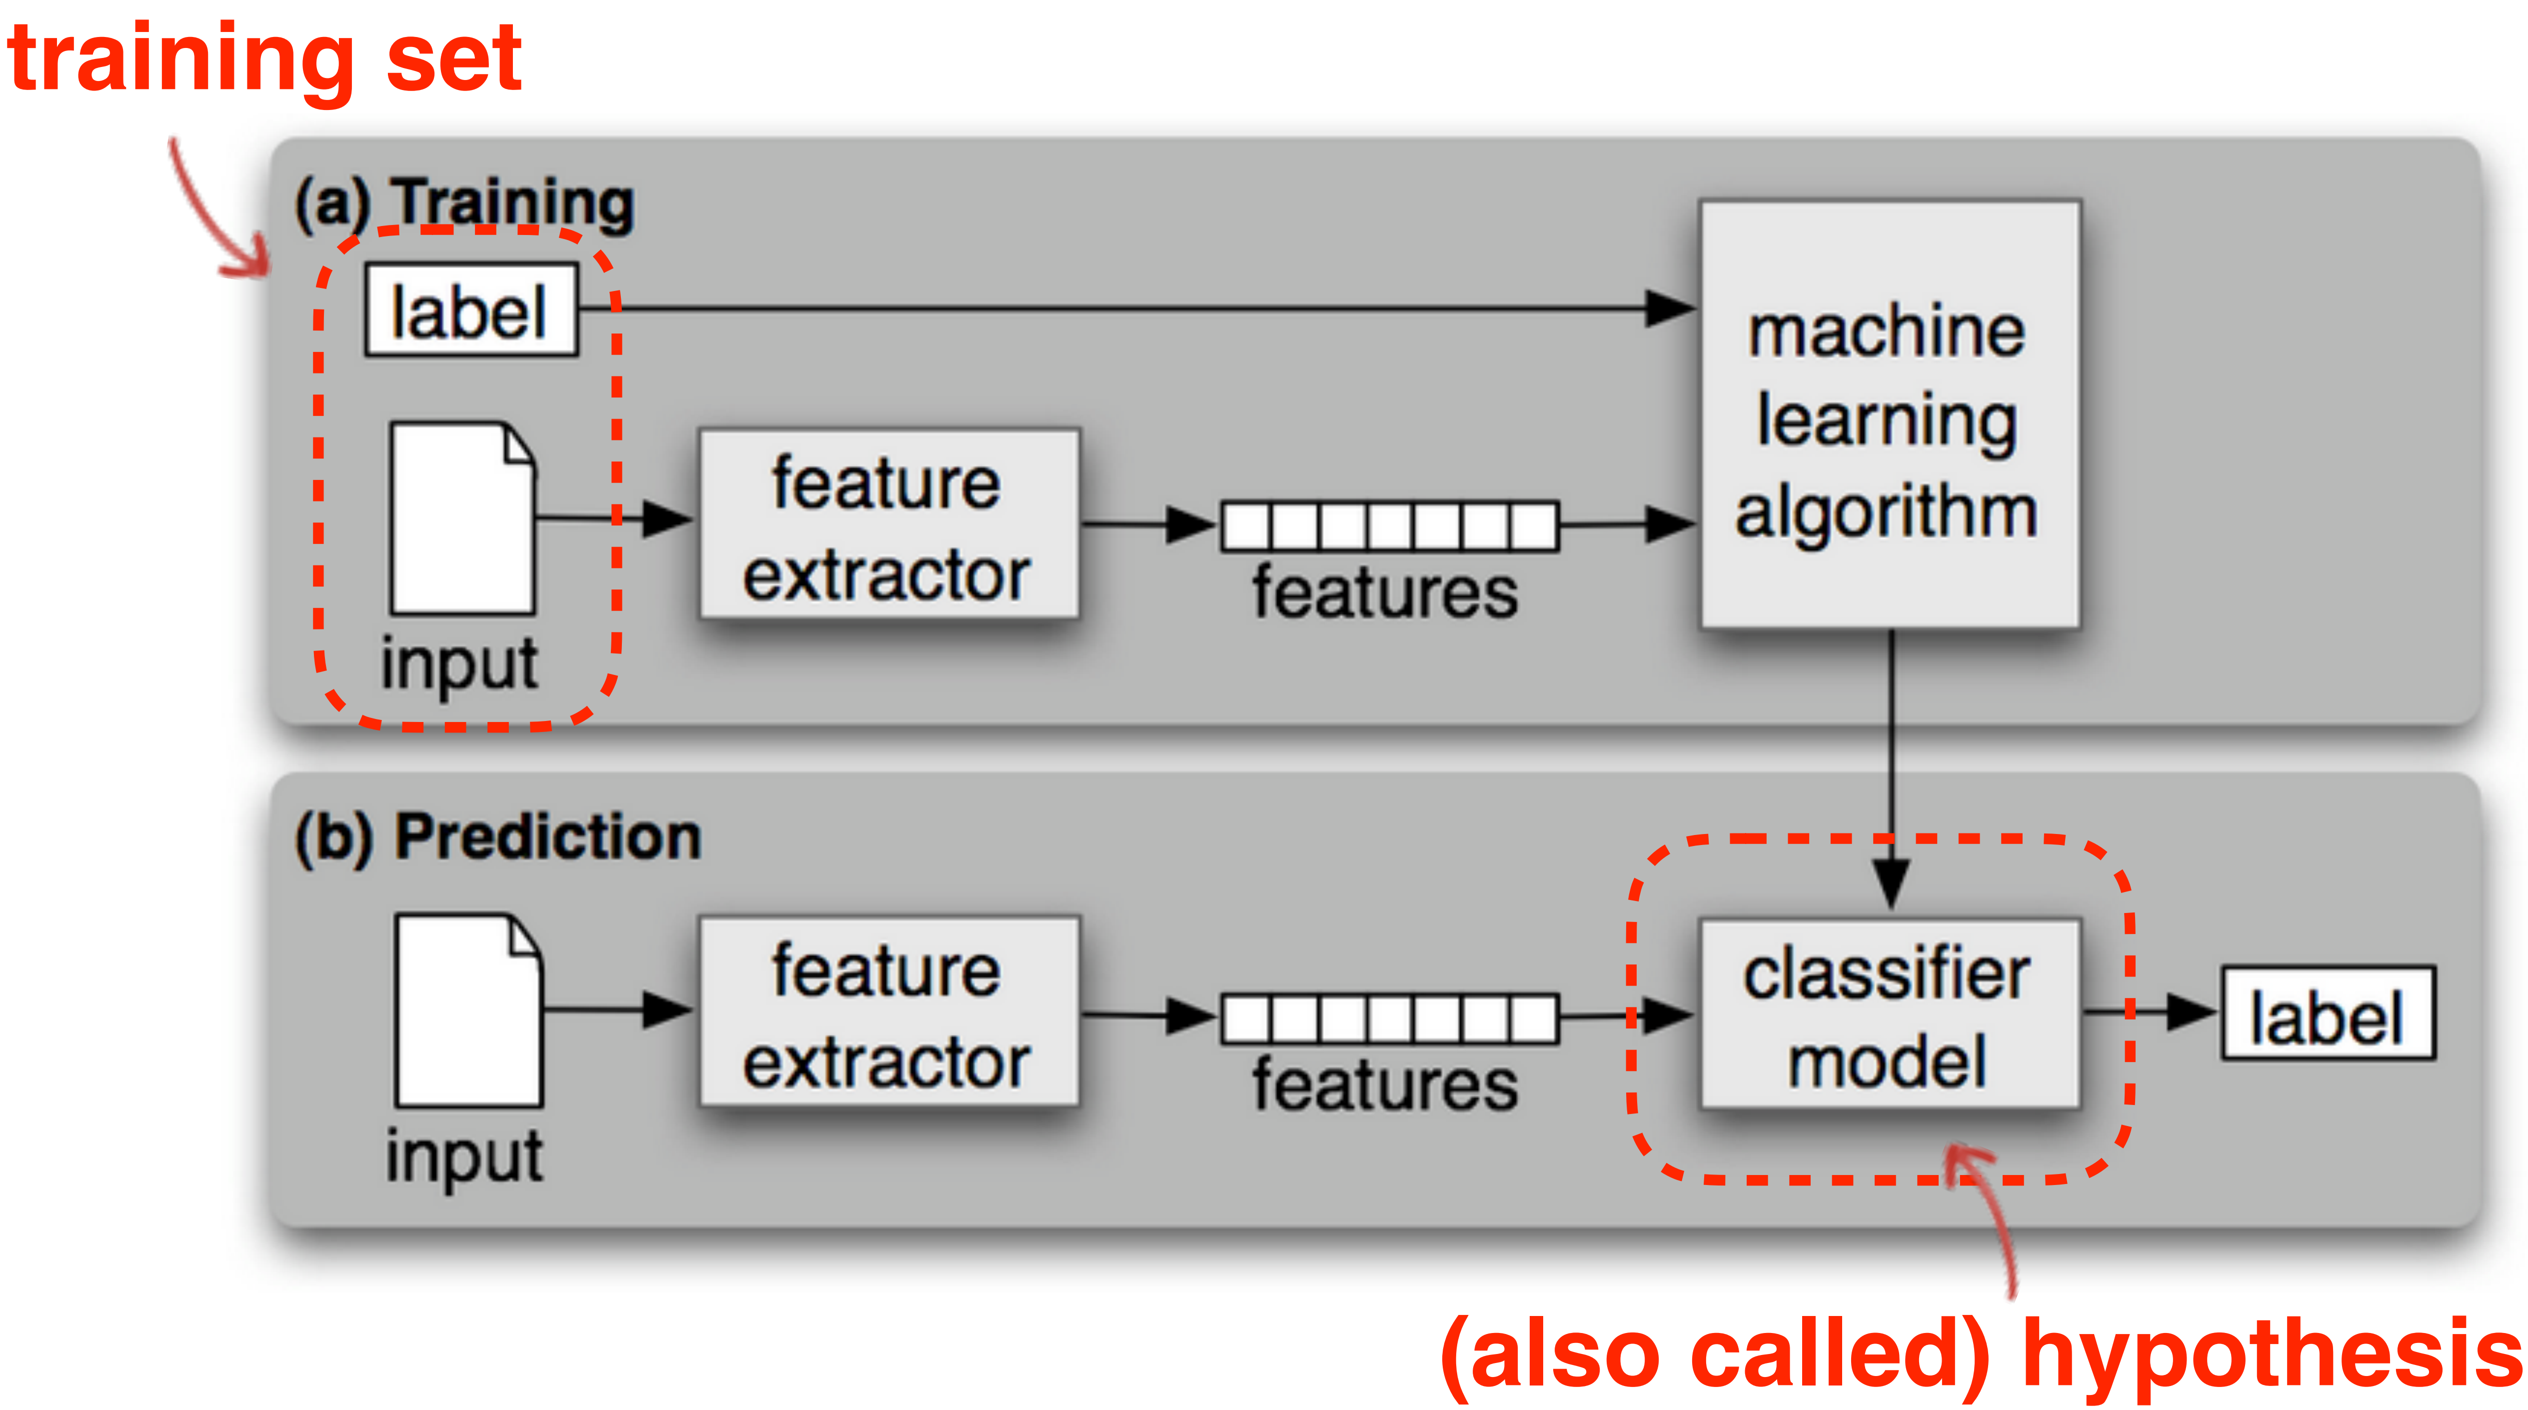
In practice, do not use linear regression for classification.

(Recap) Classification:

Supervised Machine Learning



(Recap)

Logistic Regression

- One of the most useful **supervised machine learning algorithm** for classification!
- Generally high performance for a lot of problems.
- Much more robust than Naïve Bayes
(better performance on various datasets).

Hypothesis:

Linear → Logistic Regression

Classification: ***y = 0*** or ***y = 1***

- Linear Regression: $h_\theta(x)$ can be > 1 or < 0

Hypothesis:

Linear → Logistic Regression

Classification: ***y = 0*** or ***y = 1***

- Linear Regression: $h_\theta(x)$ can be > 1 or < 0
- Logistic Regression: want $0 \leq h_\theta(x) \leq 1$

Hypothesis:

Linear → Logistic Regression

Classification: ***y = 0*** or ***y = 1***

- Linear Regression: $h_\theta(x)$ can be > 1 or < 0
- Logistic Regression: want $0 \leq h_\theta(x) \leq 1$

a classification (not regression) algorithm

“Computer”

The term "**computer**", in use from the early 17th century (the first known written reference dates from 1613),[1] meant "one who computes": a person performing mathematical calculations, before electronic computers became commercially available. "The human computer is supposed to be following fixed rules; he has no authority to deviate from them in any detail."[2] Teams of people were frequently used to undertake long and often tedious calculations; the work was divided so that this could be done in parallel.

NACA High Speed Flight Station "Computer Room" (1949)

INDEPENDENT

Culture › Film › Features

Hidden Figures takes us back to a place where computers were women and black

Computers weren’t always an electronic device – it was a job done by black women – but the relations of 1960s black politics, culture and space were far more complex than ‘Hidden Figures’ has time to show in terms of challenging prejudice

Hypothesis:

Linear → Logistic Regression

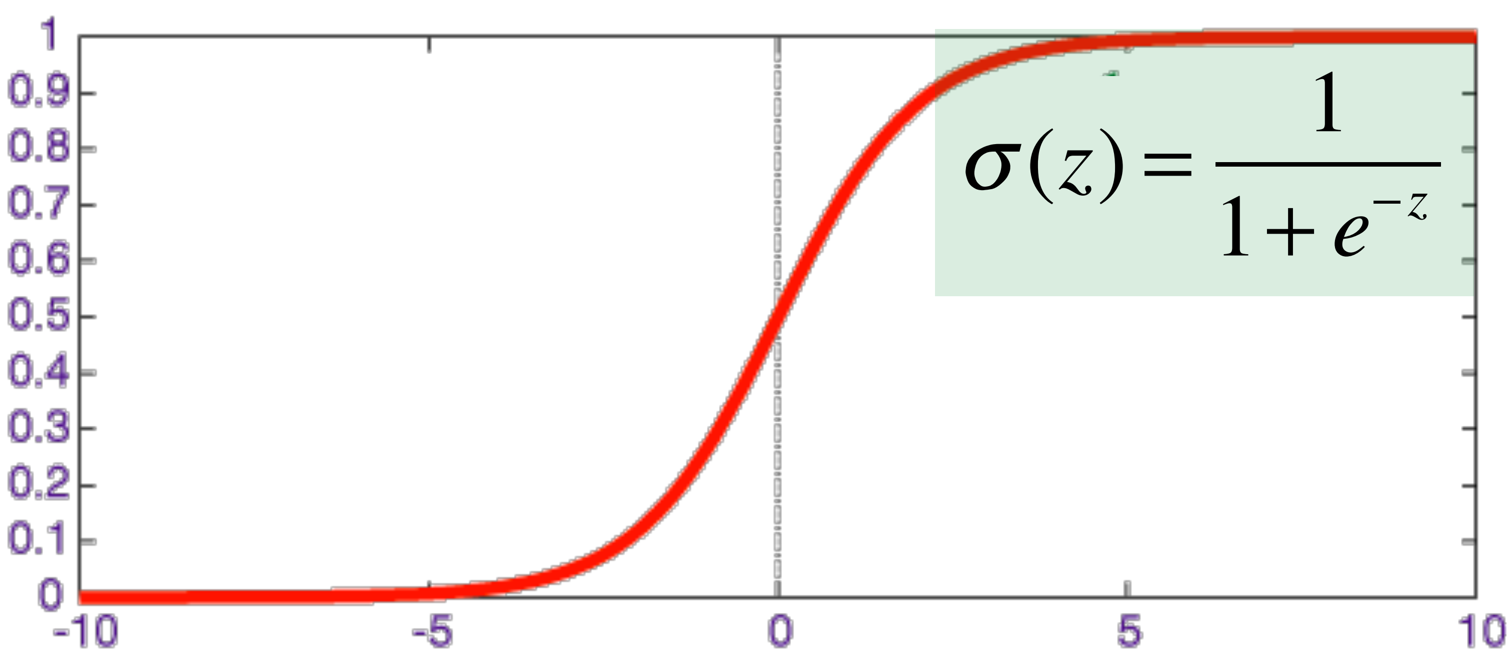
- Linear Regression: $h_\theta(x) = \theta^T x$
- Logistic Regression: want $0 \leq h_\theta(x) \leq 1$

Hypothesis:

Linear → Logistic Regression

- Linear Regression: $h_\theta(x) = \theta^T x$
- Logistic Regression: want $0 \le h_\theta(x) \le 1$

sigmoid (logistic) function



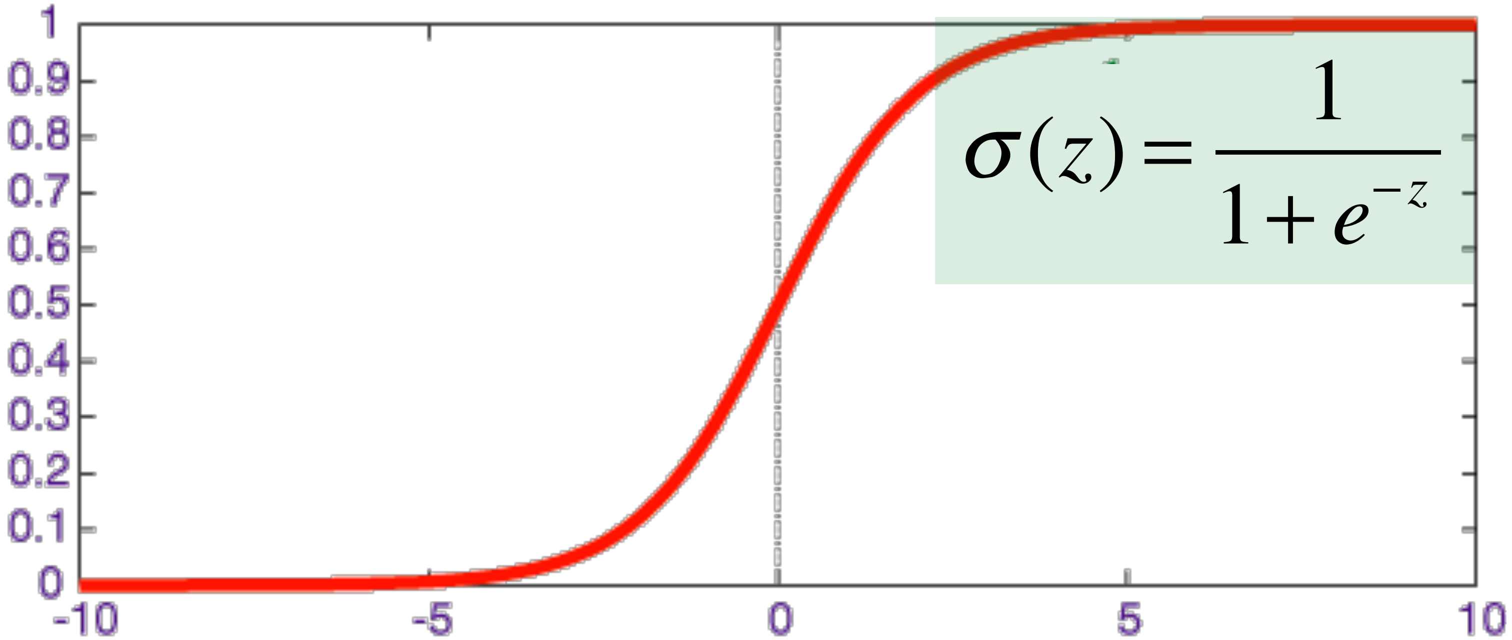
Hypothesis:

Linear → Logistic Regression

- Linear Regression: $h_\theta(x) = \theta^T x$
- Logistic Regression: want $0 \le h_\theta(x) \le 1$

$$h_\theta(x) = \sigma\left(\theta^T x\right)$$

sigmoid (logistic) function



(Recap) Classification Method:

Supervised Machine Learning

- Input:
  - a sentence pair $\boldsymbol{x}$ **(represented by features)**
  - a fixed set of binary classes $\boldsymbol{Y = \{0, 1\}}$
  - a training set of $\boldsymbol{m}$ hand-labeled sentence pairs $\boldsymbol{(x^{(1)}, y^{(1)}), \ldots, (x^{(m)}, y^{(m)})}$

- Output:
  - a learned classifier $\gamma: \boldsymbol{x} \rightarrow \boldsymbol{y} \in \boldsymbol{Y}$ ($\boldsymbol{y = 0}$ or $\boldsymbol{y = 1}$)

Logistic Regression:

Interpretation of Hypothesis

- $h_\theta(x)$ = estimated probability that $y = 1$ on input

Logistic Regression:

Interpretation of Hypothesis

- ***$h_\theta(x)$*** = estimated probability that ***$y = 1$*** on input

$$If \quad x = \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} 1 \\ \#words\_in\_common \end{bmatrix}, \; h_\theta(x) = 0.7$$

70% chance of the sentence pair being paraphrases

Logistic Regression:

Interpretation of Hypothesis

- ***$h_\theta(x)$*** = estimated probability that ***$y = 1$*** on input

$$If \quad x = \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} 1 \\ \text{\#words\_in\_common} \end{bmatrix}, \; h_\theta(x) = 0.7$$

70% chance of the sentence pair being paraphrases

$$h_\theta(x) = P(y = 1 \mid x; \theta)$$

probability that *$y = 1$*, given x, parameterized by *θ*

Logistic Regression:

Interpretation of Hypothesis

- ***$h_\theta(x)$*** = estimated probability that ***$y = 1$*** on input

$$h_\theta(x) = P(y = 1 \mid x; \theta)$$

probability that *$y = 1$*, given x, parameterized by *θ*

Logistic Regression:

Interpretation of Hypothesis

- ***$h_\theta(x)$*** = estimated probability that ***$y = 1$*** on input

$$P(y=1 \mid x;\theta)+P(y=0 \mid x;\theta)=1$$

$$h_\theta(x)=P(y=1 \mid x;\theta)$$

probability that *$y = 1$*, given x, parameterized by *θ*

Logistic Regression:

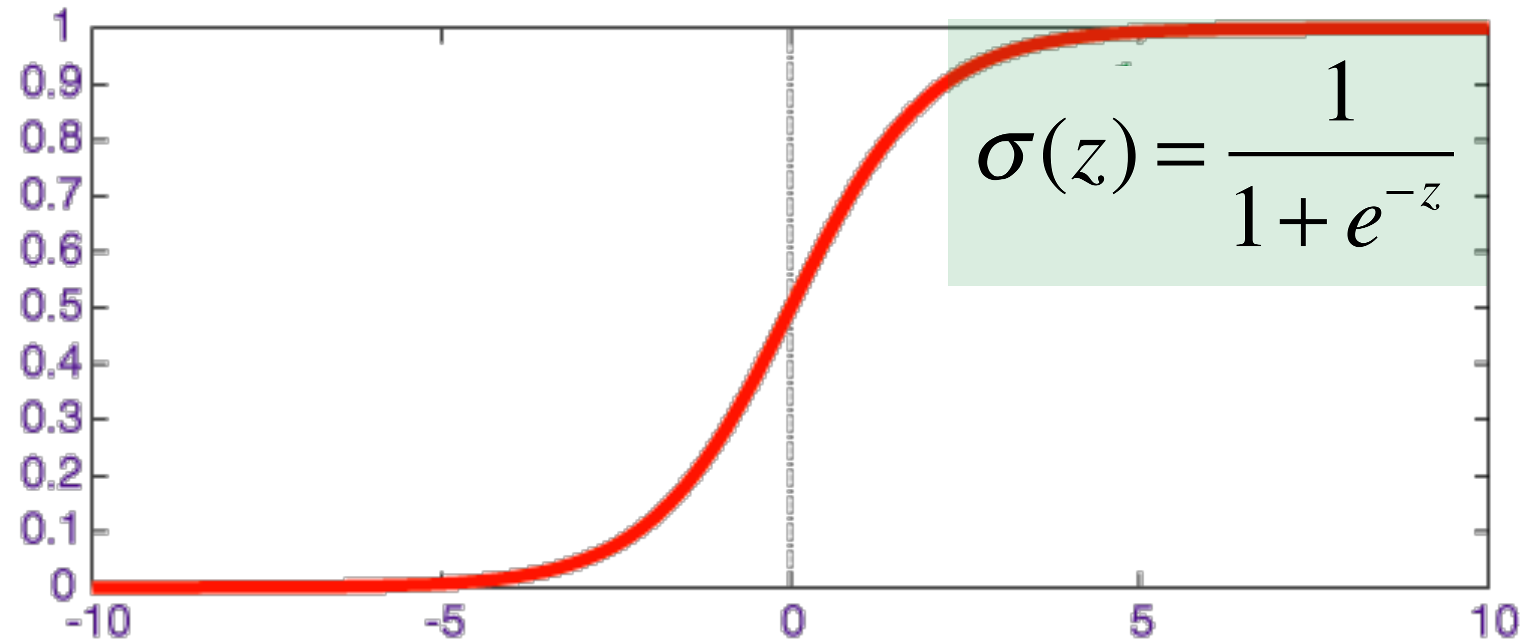
Decision Boundary

- Logistic Regression:

sigmoid (logistic) function

$$h_\theta(x) = \sigma\left(\theta^T x\right)$$

$$h_\theta(x) = \frac{1}{1+e^{-\theta^T x}}$$



Logistic Regression:

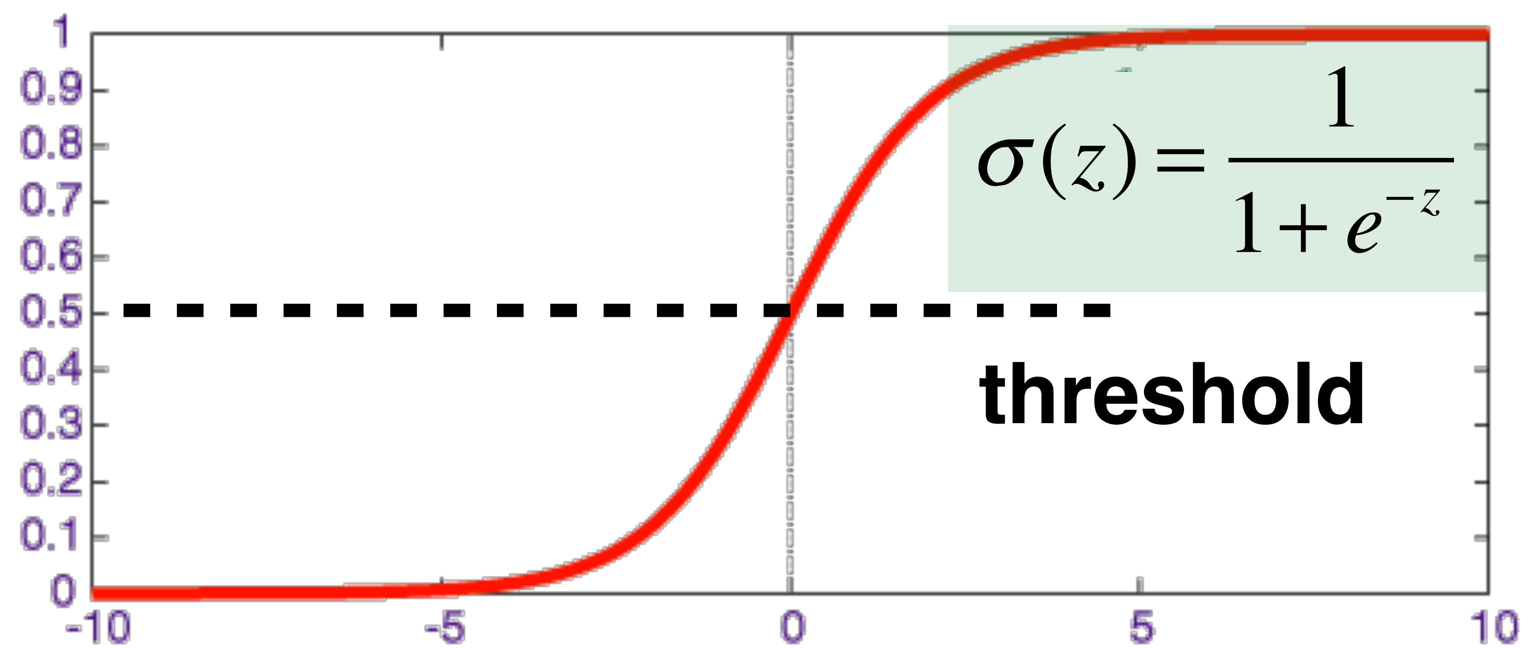
Decision Boundary

- Logistic Regression:

$$h_\theta(x) = \sigma\left(\theta^T x\right)$$

$$h_\theta(x) = \frac{1}{1+e^{-\theta^T x}}$$

sigmoid (logistic) function



predict ***y = 1*** if ***h$_\theta$(x) ≥ 0.5***

predict ***y = 0*** if ***h$_\theta$(x) < 0.5***

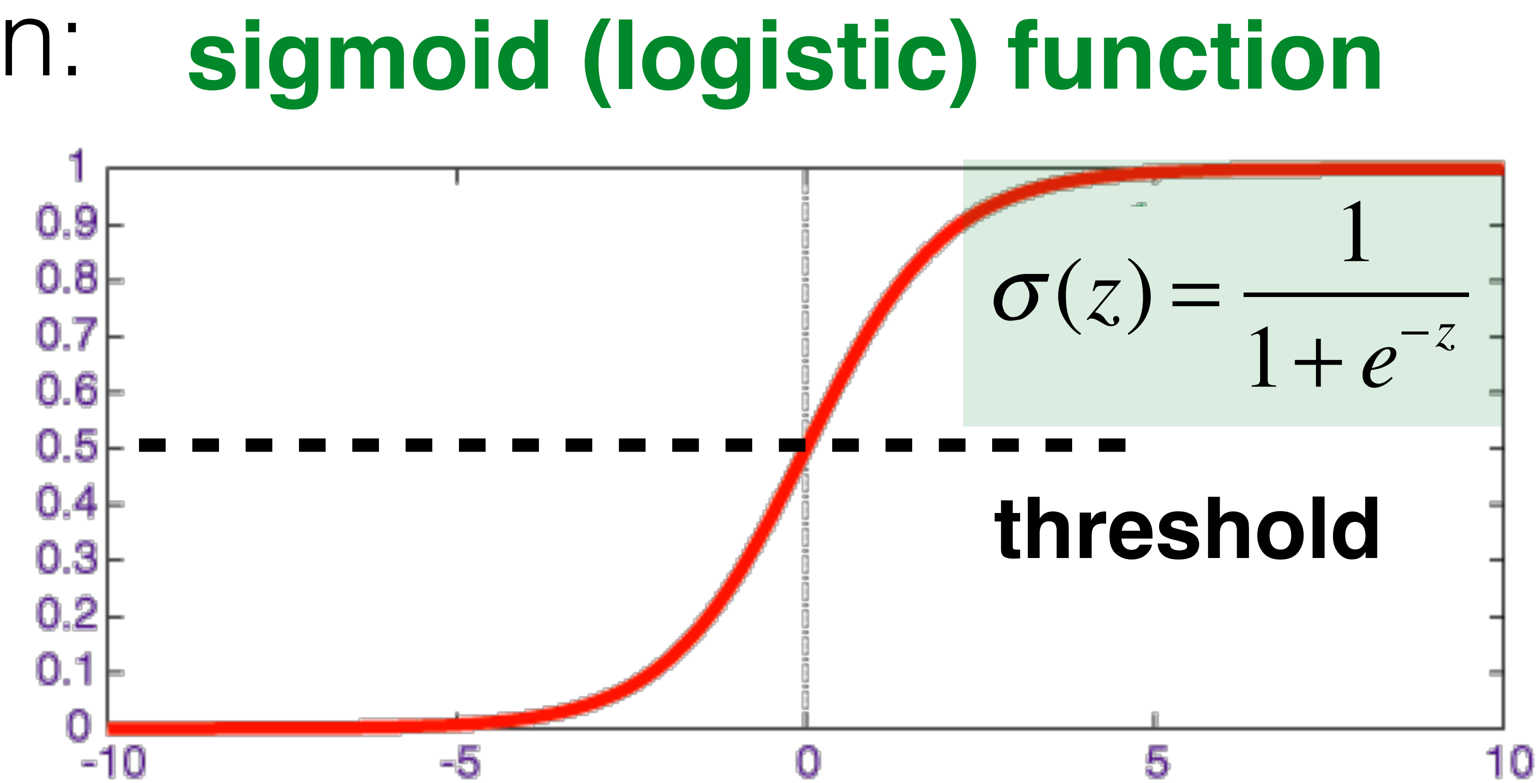
Logistic Regression:

Decision Boundary

- Logistic Regression:

$$h_\theta(x) = \sigma\left(\theta^T x\right)$$

$$h_\theta(x) = \frac{1}{1+e^{-\theta^T x}}$$

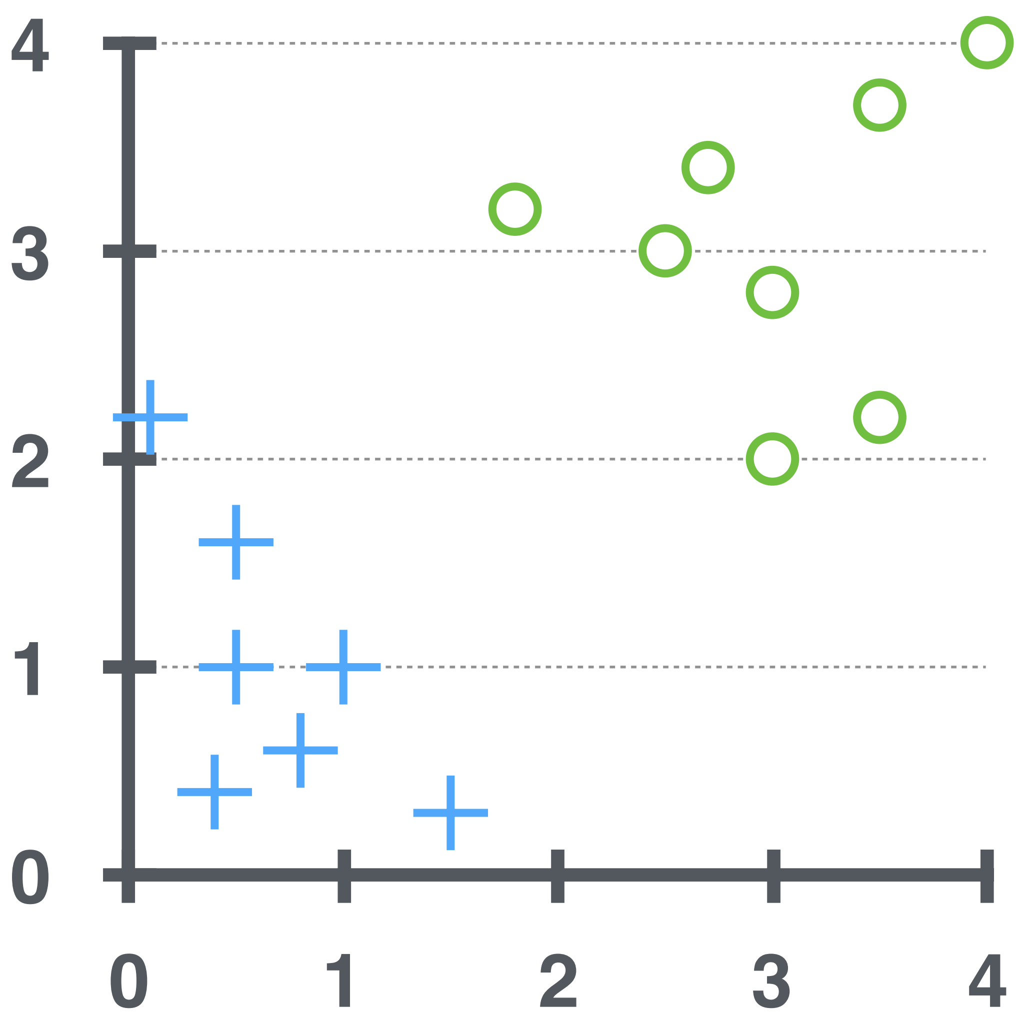


predict ***y* = 1** if ***h*θ(*x*) ≥ 0.5** ⟵ when ***θ*ᵀ*x* ≥ 0**

predict ***y* = 0** if ***h*θ(*x*) < 0.5** ⟵ when ***θ*ᵀ*x* < 0**

Logistic Regression:

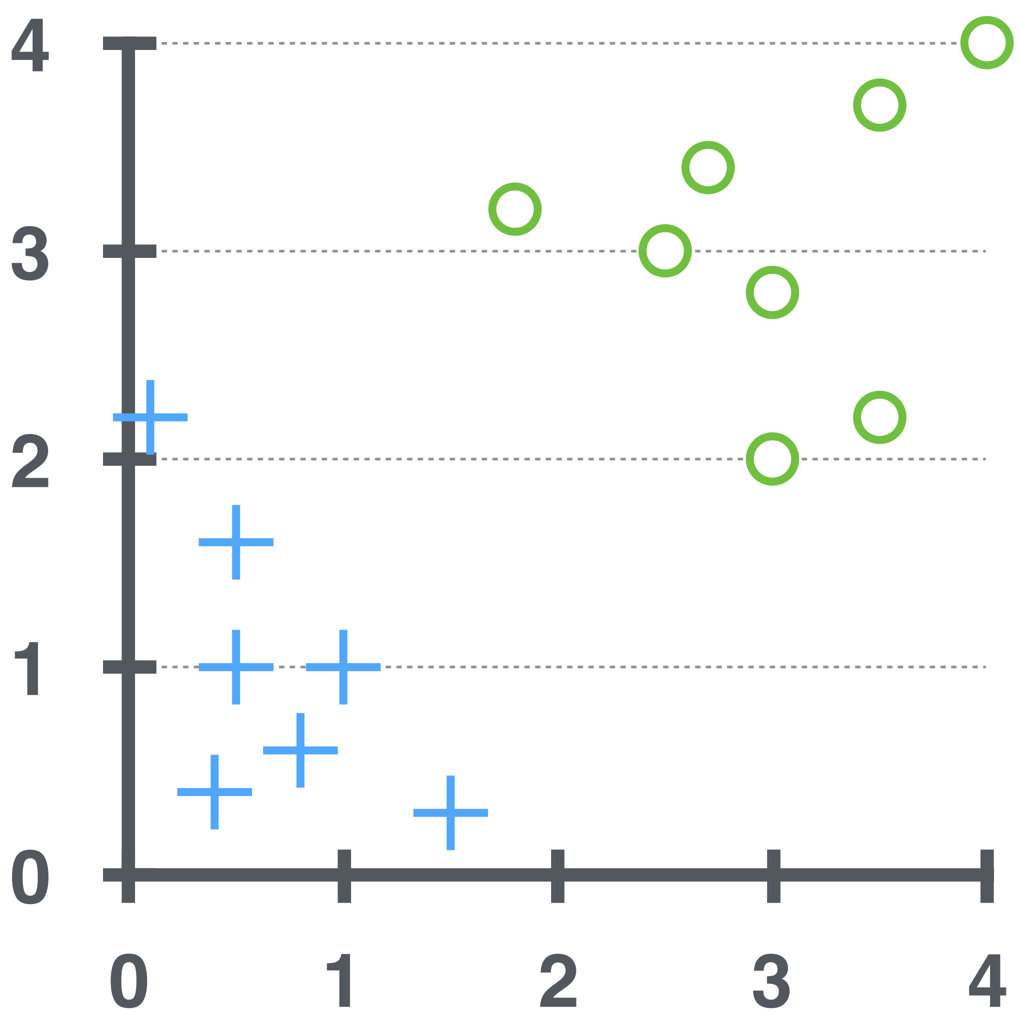
Decision Boundary



Logistic Regression:

Decision Boundary

$$h_\theta(x) = \sigma(\theta_0 + \theta_1 x_1 + \theta_2 x_2)$$



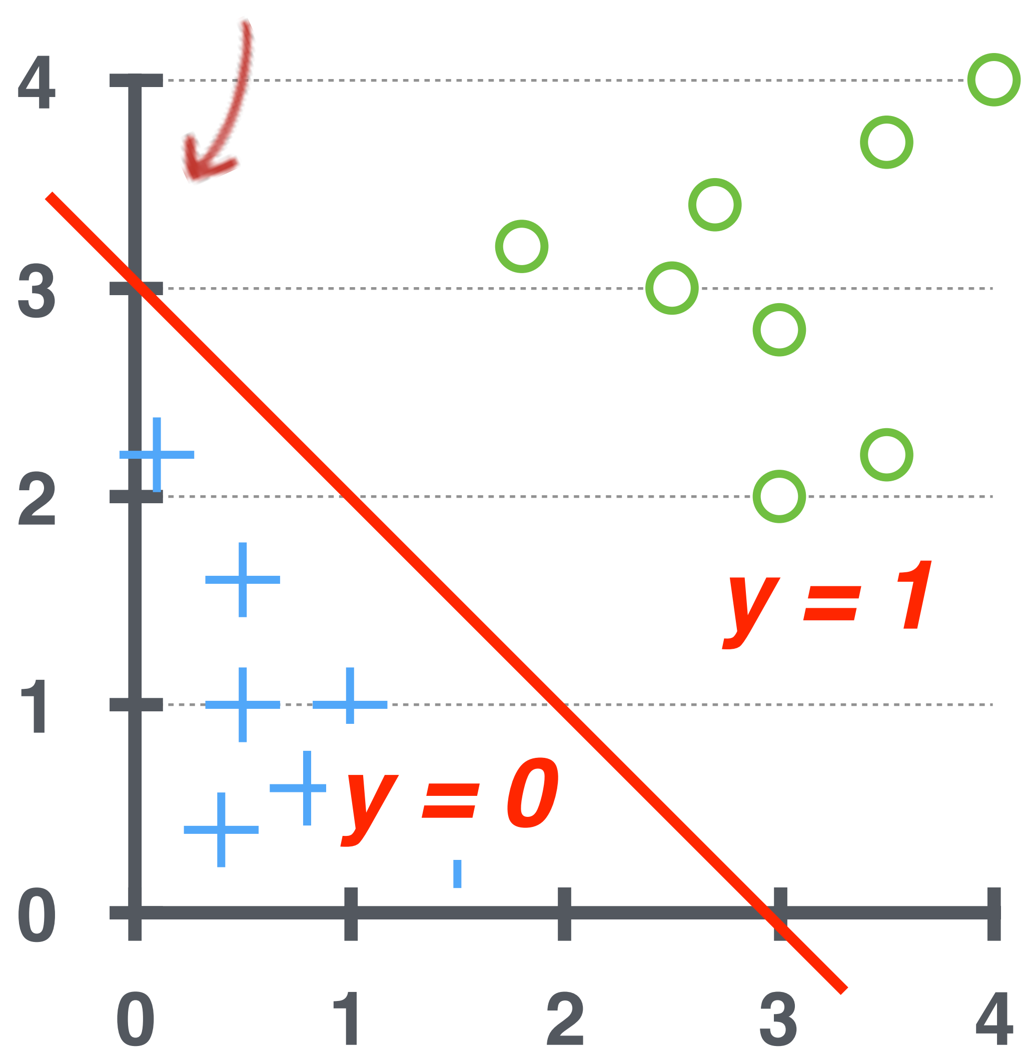
What if $\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \\ 1 \end{bmatrix}$?

predict ***y = 1*** if $\boldsymbol{\theta^T x \geq 0}$

Logistic Regression:

Decision Boundary

decision boundary



$$h_\theta(x) = \sigma(\theta_0 + \theta_1 x_1 + \theta_2 x_2)$$

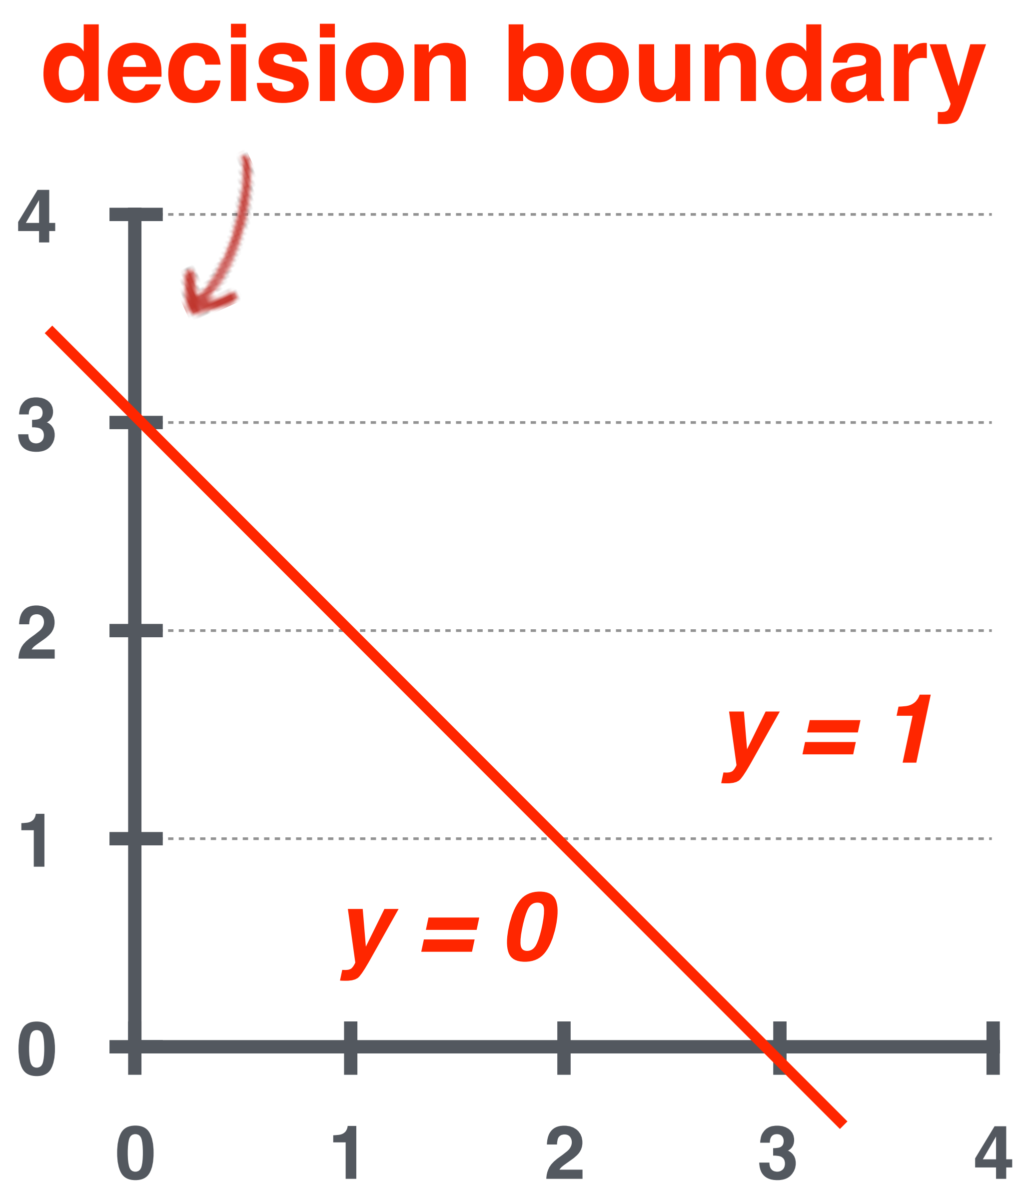
What if $\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \\ 1 \end{bmatrix}$?

predict ***y = 1*** if $\theta^T x \geq 0$

Logistic Regression:

Decision Boundary

$$h_\theta(x) = \sigma\left(\theta_0 + \theta_1 x_1 + \theta_2 x_2\right)$$



a property of the hypothesis

a property of the parameters

~~a property of the dataset~~

Logistic Regression

- a training set of ***m*** hand-labeled sentence pairs

$(x^{(1)}, y^{(1)}), \ldots, (x^{(m)}, y^{(m)})$ ($y \in \{0, 1\}$)

$$h_\theta(x) = \frac{1}{1+e^{-\theta^T x}}$$

$$x = \begin{bmatrix} x_0 \\ x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \in R^{n+1} \quad \theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix} \in R^{n+1}$$

Cost function:

Linear → Logistic Regression

- Linear Regression: $J(\theta) = \frac{1}{m}\sum_{i=1}^{m}\frac{1}{2}\left(h_\theta(x^{(i)}) - y^{(i)}\right)^2$

squared error function

Cost function:

Linear → Logistic Regression

- Linear Regression: $$J(\theta)=\frac{1}{m}\sum_{i=1}^{m}\frac{1}{2}\left(\boxed{h_\theta(x^{(i)})}-y^{(i)}\right)^2$$

squared error function

- Logistic Regression: $$h_\theta(x)=\frac{1}{1+e^{-\theta^T x}}$$

this cost function is non-convex for logistic regression

Cost function:

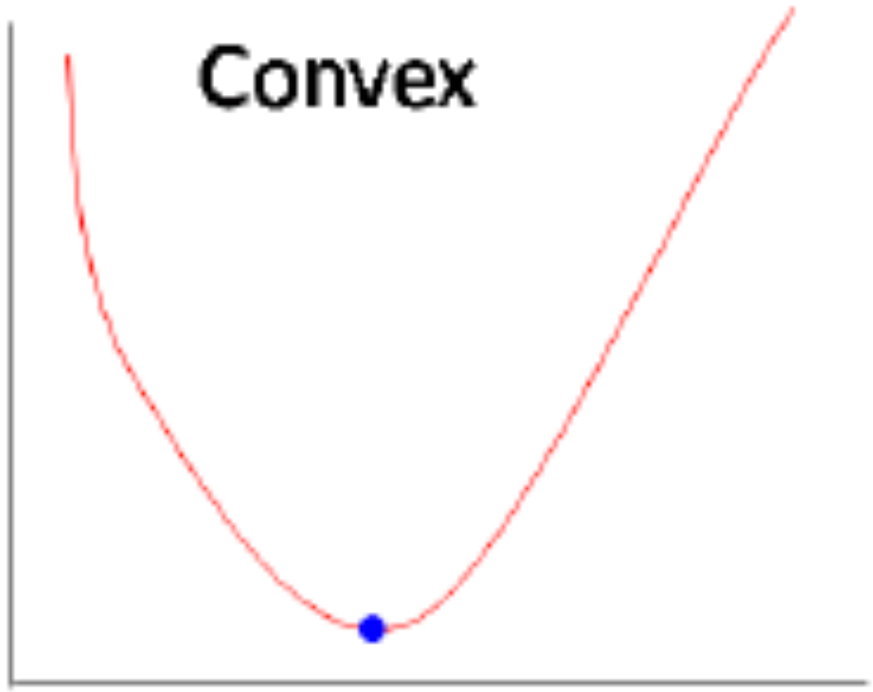
Linear → Logistic Regression

- Linear Regression: $J(\theta) = \frac{1}{m}\sum_{i=1}^{m} \boxed{\frac{1}{2}\left(h_\theta(x^{(i)}) - y^{(i)}\right)^2}$

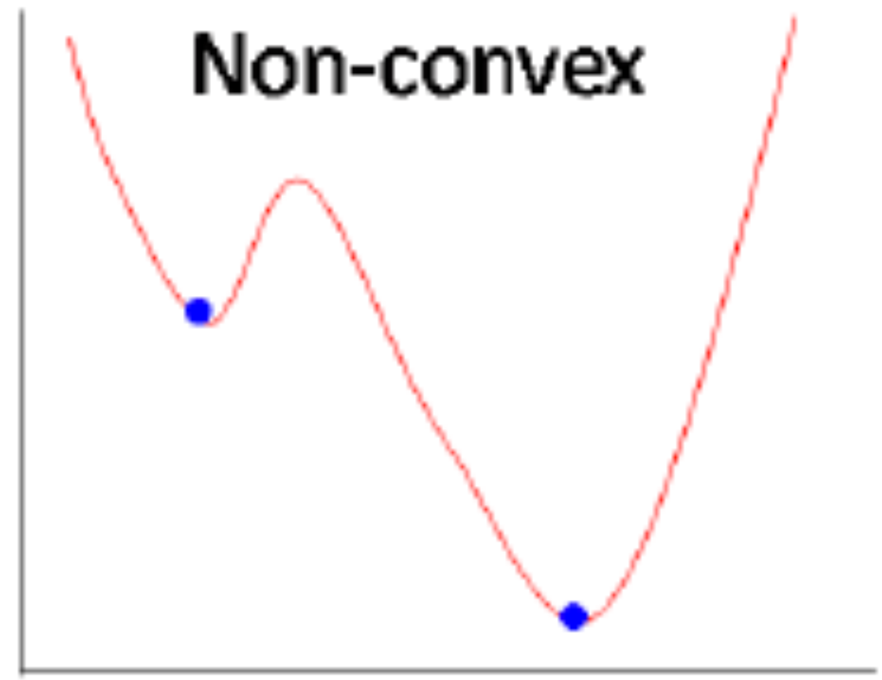
$$\begin{array}{c} \shortparallel \\ \boxed{\mathrm{Cost}\left(h_\theta(x), y\right)} \end{array}$$

- Logistic Regression: $h_\theta(x) = \frac{1}{1+e^{-\theta^T x}}$

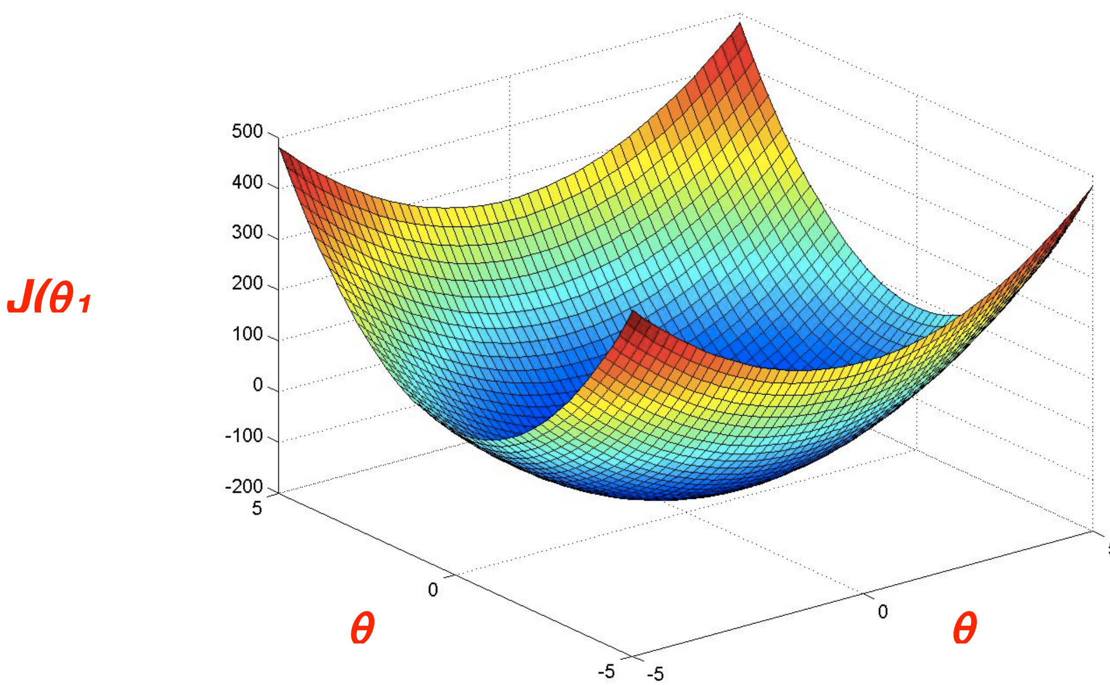
this cost function is non-convex for logistic regression



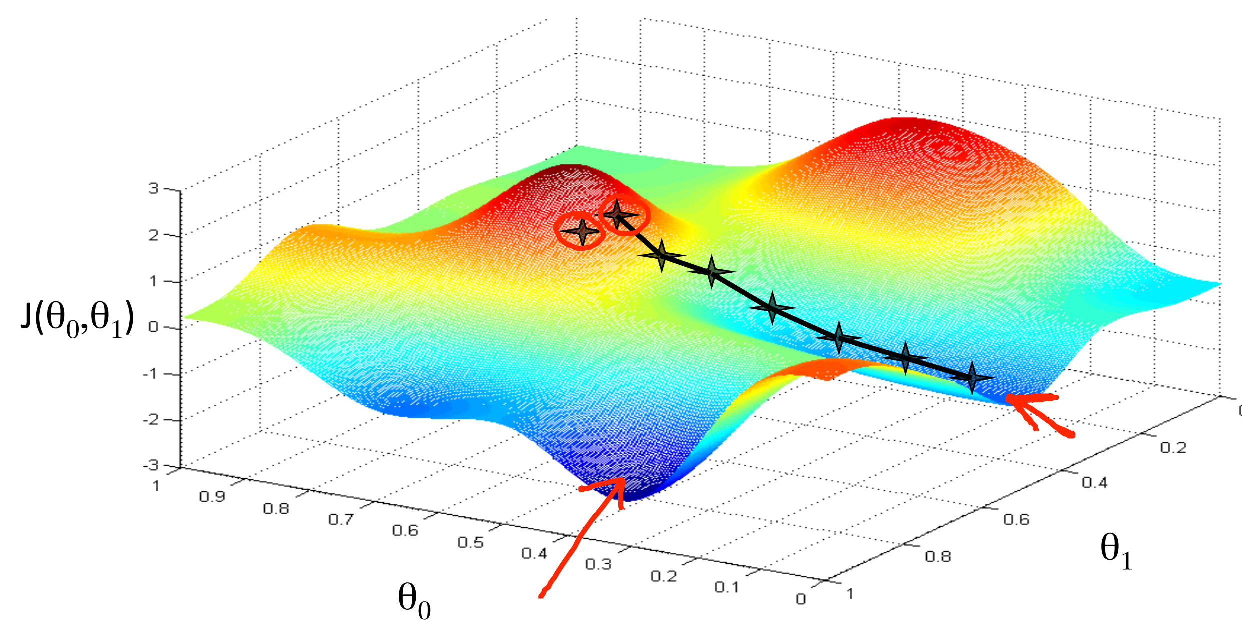
Convex



Non-convex

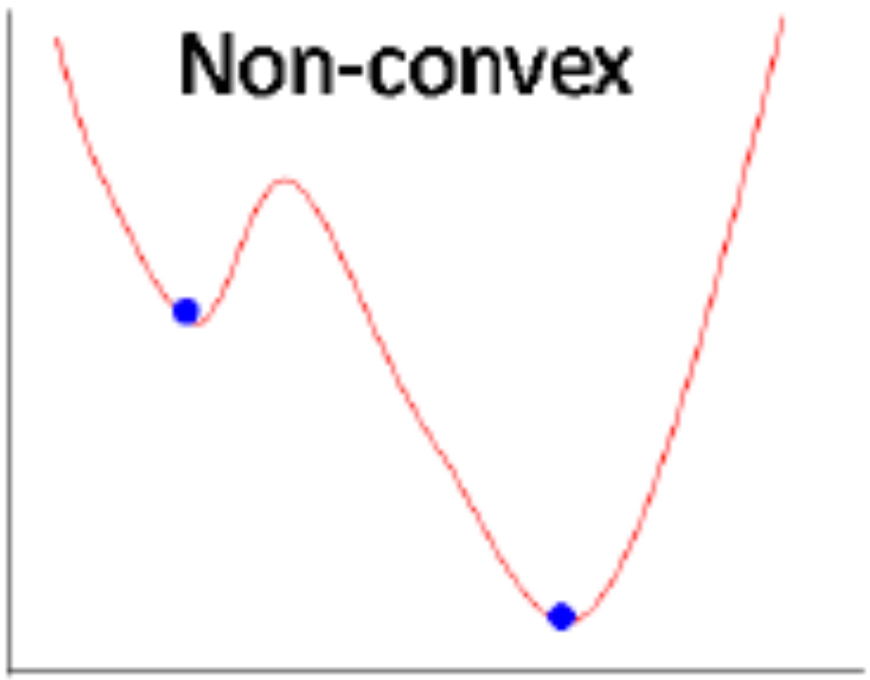


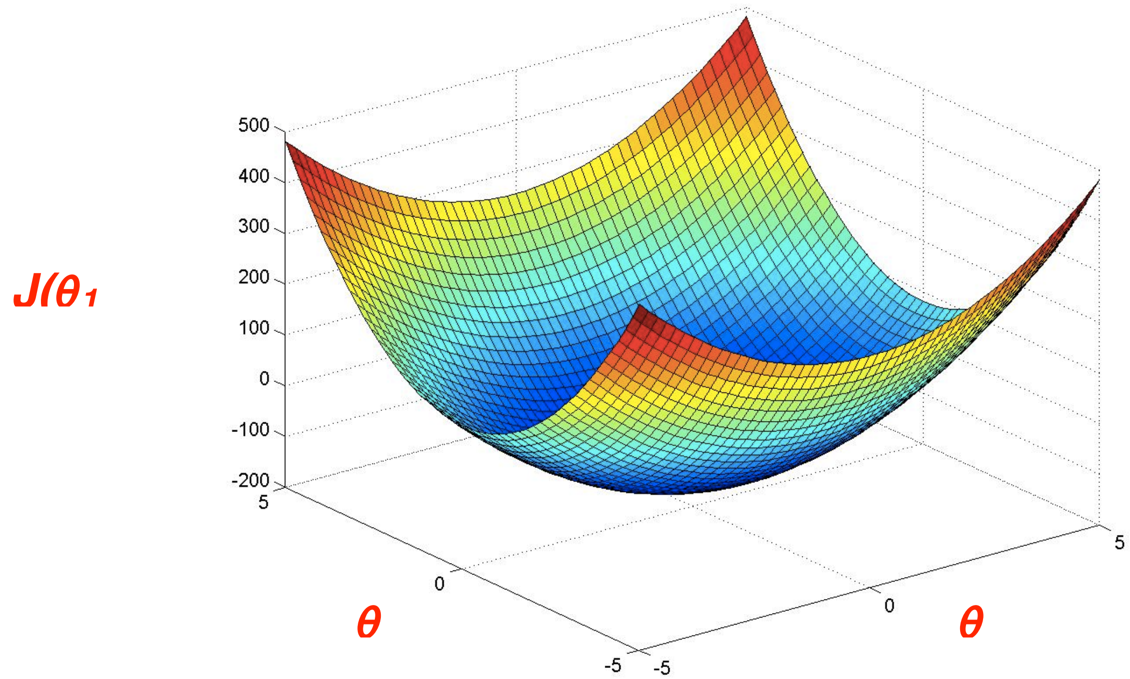
J(θ₁
θ
θ

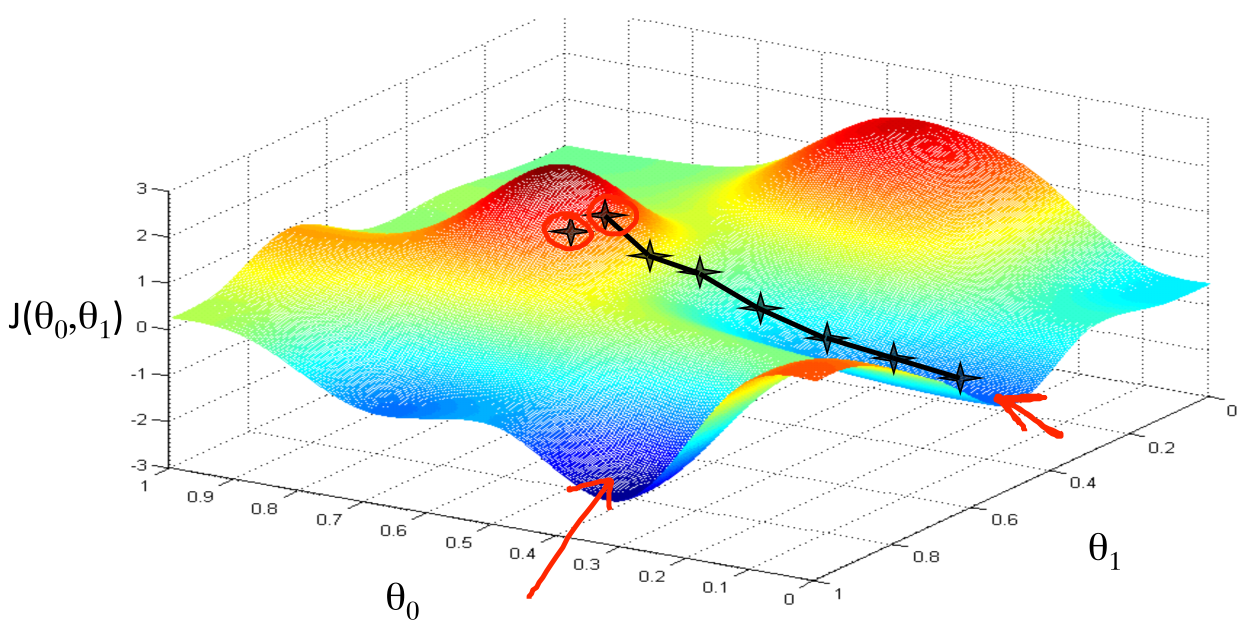


J(θ0,θ1)
θ0
θ1

we want convex! easy gradient descent!







Logistic Regression:

Cost Function

$$\mathrm{Cost}\big(h_\theta(x), y\big) = \begin{cases} -\log(h_\theta(x)) & \text{if } \ y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } \ y = 0 \end{cases}$$

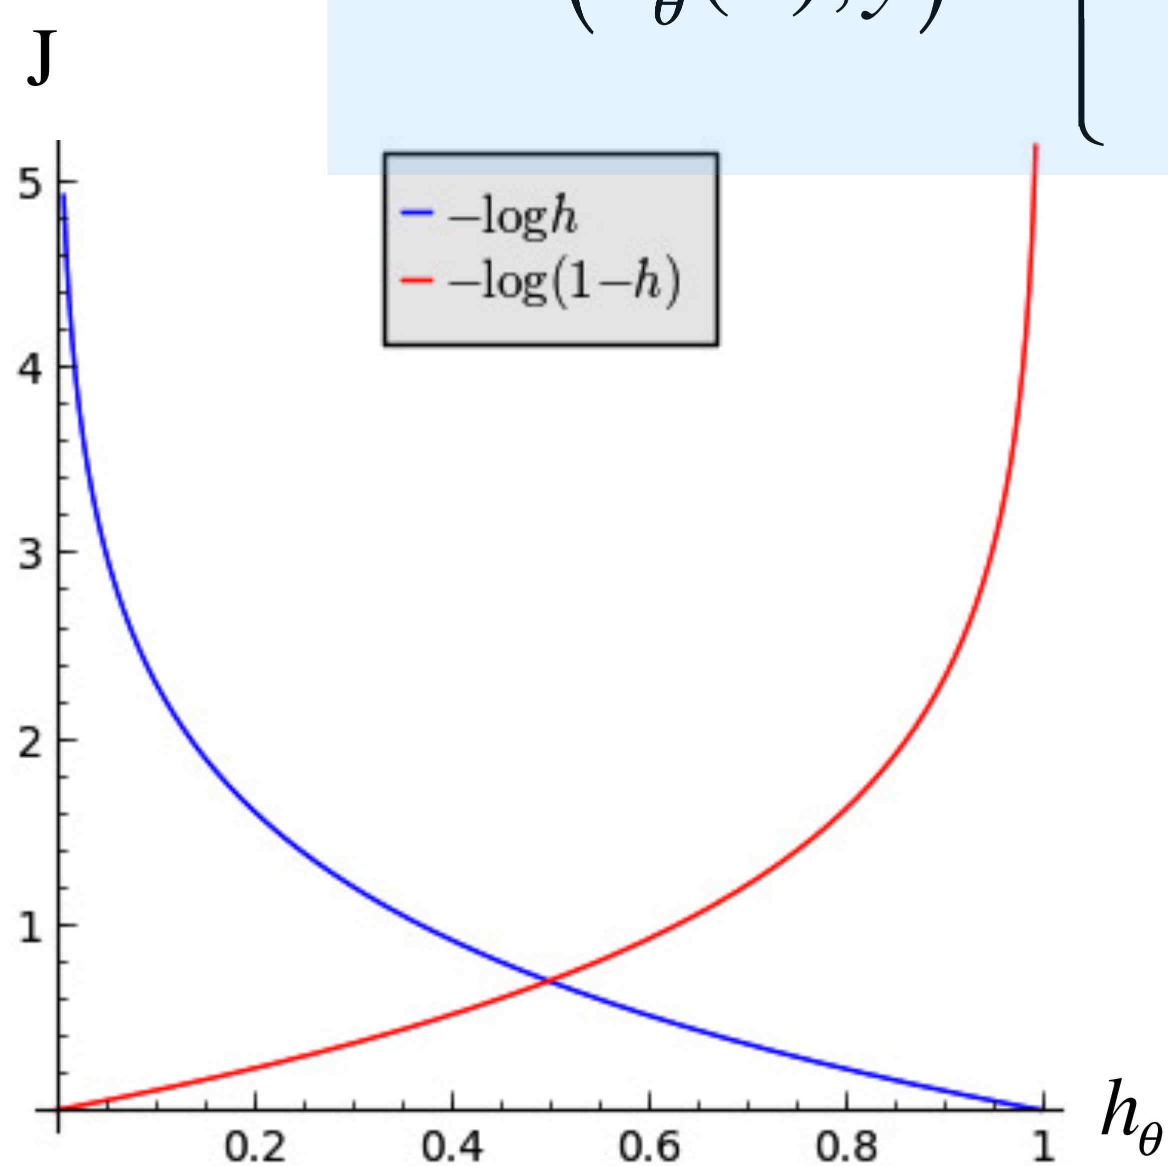
remember that

$$0 \le h_\theta(x) \ \le 1$$

Logistic Regression:

Cost Function

$$\mathrm{Cost}\big(h_\theta(x), y\big) = \begin{cases} -\log(h_\theta(x)) & \text{if } \; y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } \; y = 0 \end{cases}$$



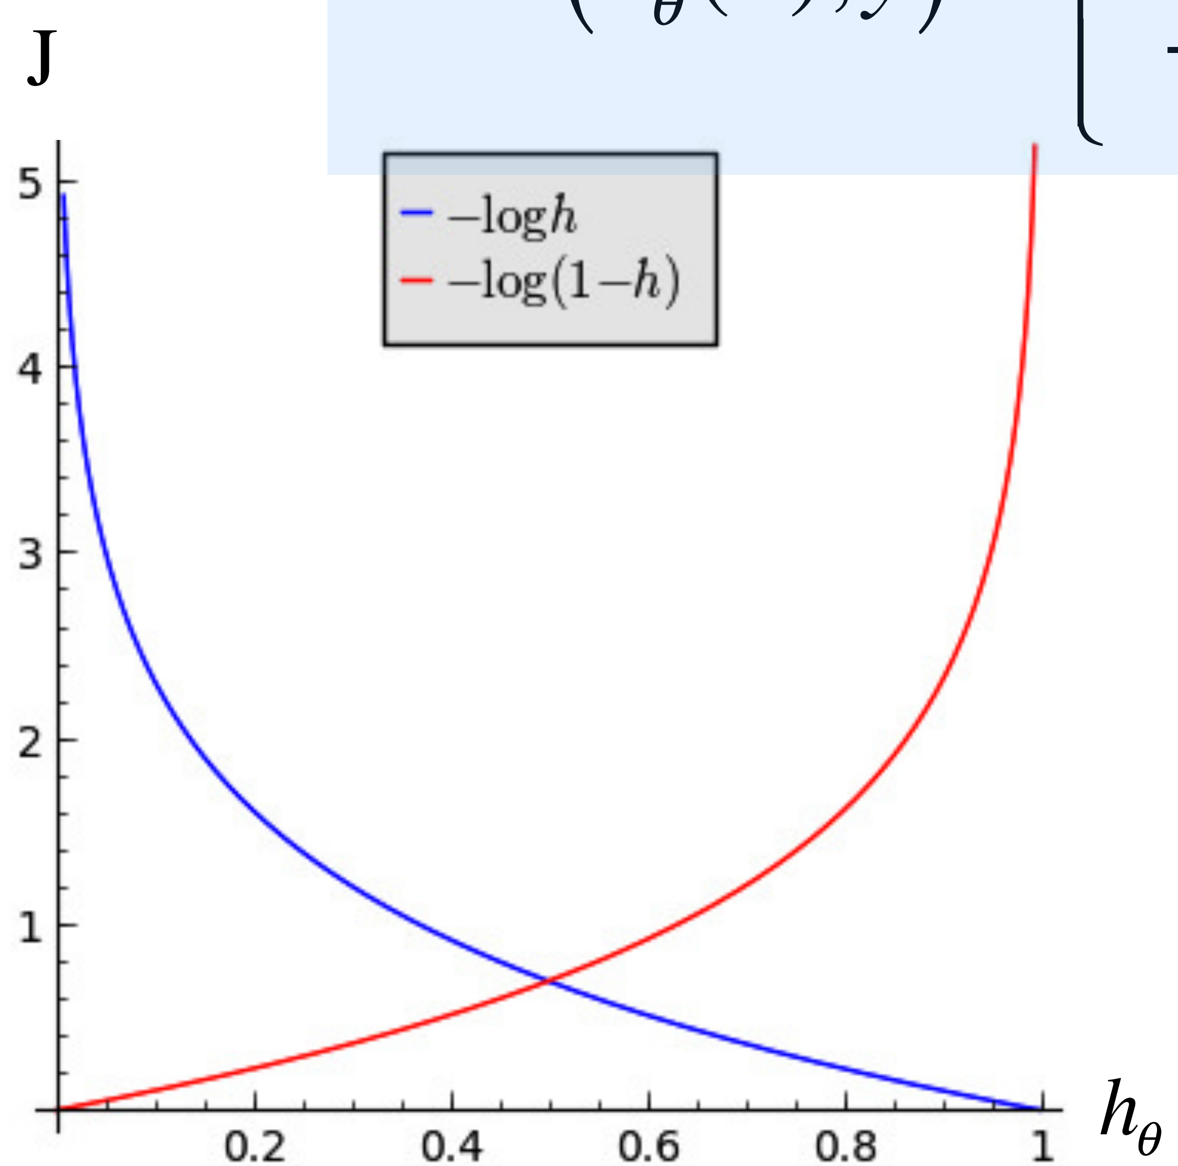
remember that

$$0 \le h_\theta(x) \le 1$$

Logistic Regression:

Cost Function

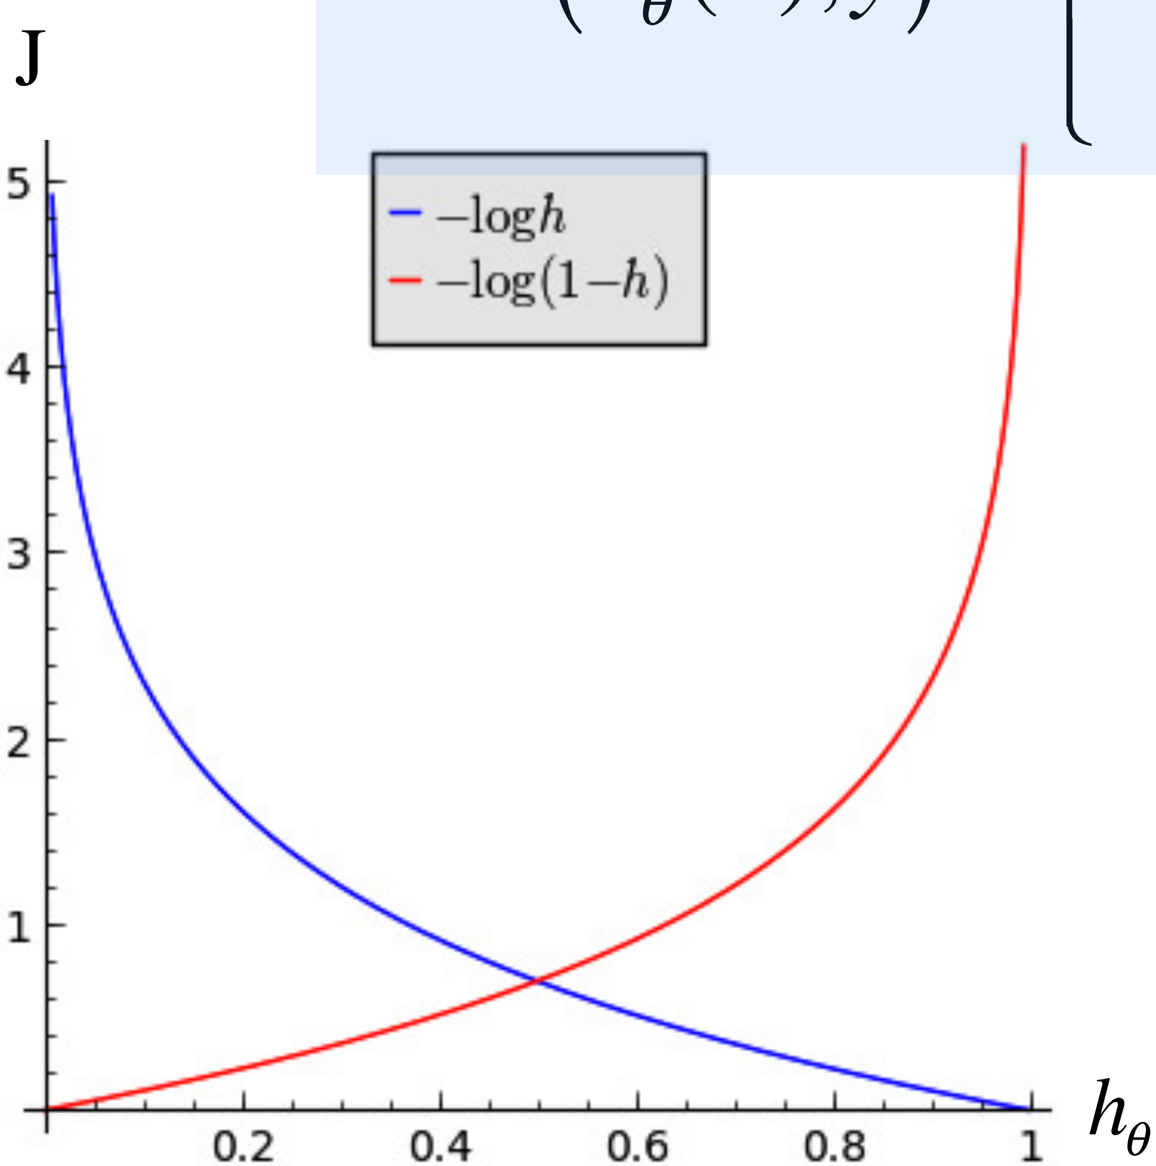
$$\mathrm{Cost}\big(h_\theta(x),y\big)=\begin{cases}-\log(h_\theta(x)) & \text{if } y=1\\ -\log(1-h_\theta(x)) & \text{if } y=0\end{cases}$$



Logistic Regression:

Cost Function

$$\mathrm{Cost}\big(h_\theta(x), y\big) = \begin{cases} -\log(h_\theta(x)) & \text{if } \; y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } \; y = 0 \end{cases}$$



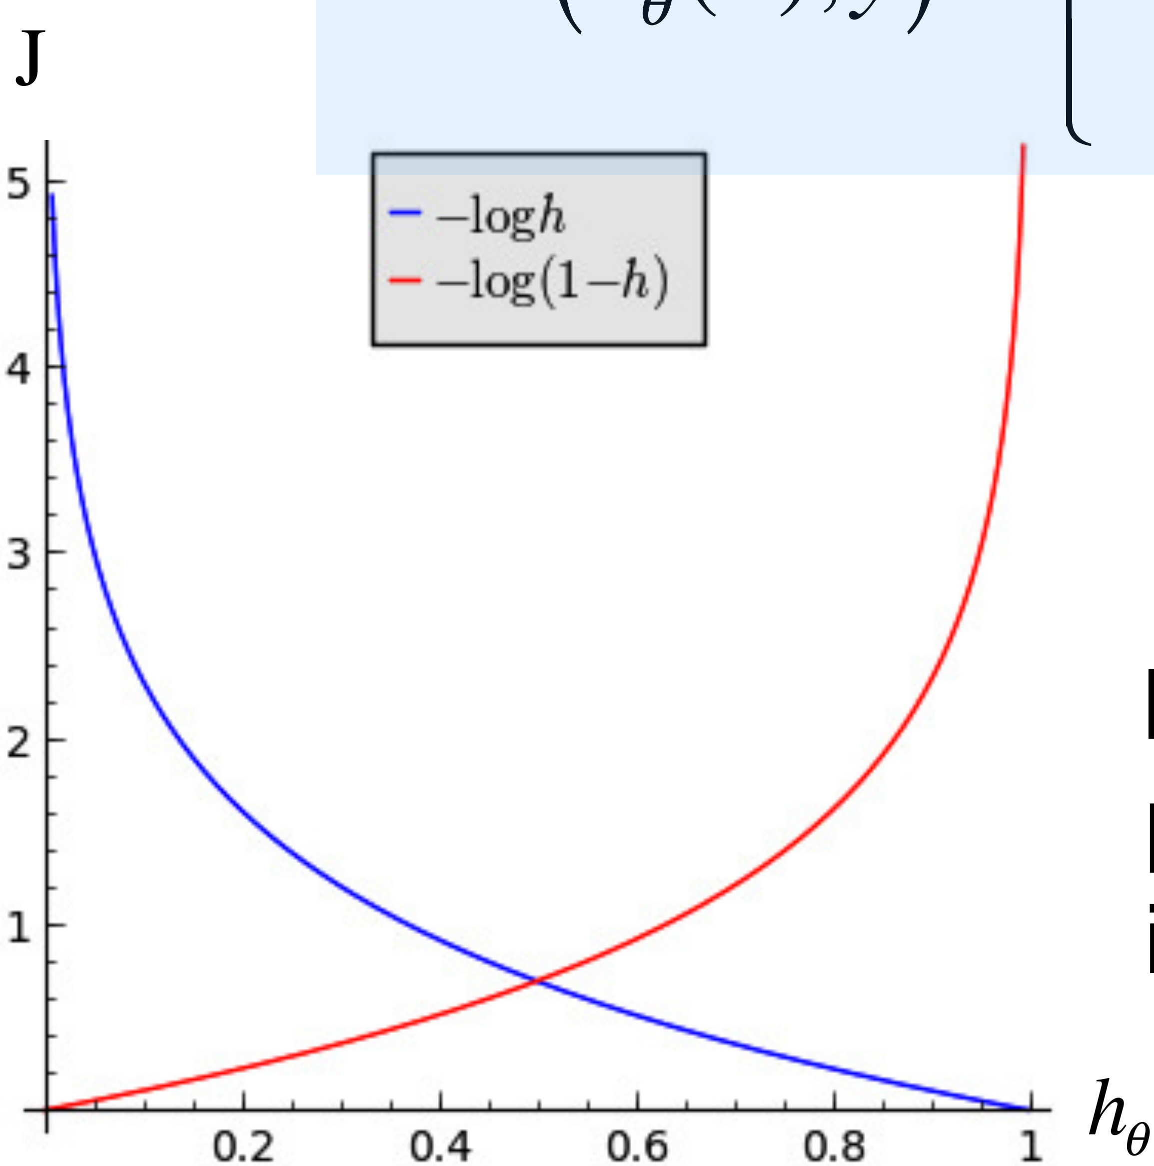
Cost = 0 if ***y = 1***, ***$h_\theta(x)$ = 1***

But as ***$h_\theta(x) \rightarrow 0$***, ***Cost $\rightarrow \infty$***

Logistic Regression:

Cost Function

$$\text{Cost}\big(h_\theta(x), y\big) = \begin{cases} -\log(h_\theta(x)) & \text{if } \; y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } \; y = 0 \end{cases}$$



Cost = 0 if ***y = 1***, ***h_θ(x) = 1***

But as ***h_θ(x) → 0*** , ***Cost → ∞***

Intuition:

penalize learning algorithm

if ***h_θ(x) = 0*** (predict **P(y=1|x;θ) = 0**),

but ***y = 1***

Logistic Regression:

Cost Function

$$J(\theta) = \frac{1}{m}\sum_{i=1}^{m}\mathrm{Cost}\left(h_\theta(x^{(i)}) - y^{(i)}\right)$$

$$\mathrm{Cost}\left(h_\theta(x), y\right) = \begin{cases} -\log(h_\theta(x)) & \text{if } y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } y = 0 \end{cases}$$

remember that $y = 0$ or 1 always

Logistic Regression:

Cost Function

$$J(\theta) = \frac{1}{m}\sum_{i=1}^{m} \mathrm{Cost}\left(h_\theta(x^{(i)}) - y^{(i)}\right)$$

$$\mathrm{Cost}\left(h_\theta(x), y\right) = \begin{cases} -\log(h_\theta(x)) & \text{if } y = 1 \\ -\log(1 - h_\theta(x)) & \text{if } y = 0 \end{cases}$$

remember that $y = 0$ or 1 always

the same

cross entropy loss:

$$\mathrm{Cost}\left(h_\theta(x), y\right) = -y\log(h_\theta(x)) - \left(1 - y\right)\log(1 - h_\theta(x))$$

Learn more: https://en.wikipedia.org/wiki/Cross_entropy

Logistic Regression

- **Cost Function:**

$$J(\theta) = \frac{1}{m}\sum_{i=1}^{m}\mathrm{Cost}\left(h_\theta(x^{(i)}) - y^{(i)}\right)$$

$$= -\frac{1}{m}\sum_{i=1}^{m} y^{(i)}\log(h_\theta(x^{(i)})) + \left(1 - y^{(i)}\right)\log(1 - h_\theta(x^{(i)}))$$

- **Goal:**

learn parameters θ to $\underset{\theta}{\mathrm{minimize}}\, J(\theta)$

- **Hypothesis (to make a prediction):** $h_\theta(x) = \dfrac{1}{1+e^{-\theta^T x}}$

P(y=1|x;θ)

Logistic Regression:

Gradient Descent

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

}

simultaneous update for all θ_j

learning rate

Logistic Regression:

Gradient Descent

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

simultaneous update for all θ_j

}

learning rate

 # training examples

$$\frac{\partial}{\partial \theta_j} J(\theta) = \frac{1}{m} \sum_{i=1}^{m} \left(h_\theta(x^{(i)}) - y^{(i)} \right) x_j^{(i)}$$

Logistic Regression:

Gradient Descent

simultaneous update for all θ_j

repeat until convergence {

$$\theta_j := \theta_j - \alpha \sum_{i=1}^{m} \left(h_\theta(x^{(i)}) - y^{(i)} \right) x_j^{(i)}$$

}

$$\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix}$$

Logistic Regression:

Gradient Descent

simultaneous update for all θ_j

repeat until convergence {

$$\theta_j := \theta_j - \alpha \sum_{i=1}^{m} \left(h_\theta(x^{(i)}) - y^{(i)} \right) x_j^{(i)}$$

}

$$\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix}$$

This look the same as linear regression!!???

Logistic Regression:

Gradient Descent

repeat until convergence {

$$\theta_j := \theta_j - \alpha \sum_{i=1}^{m} \left(h_\theta(x^{(i)}) - y^{(i)} \right) x_j^{(i)}$$

}

simultaneous update for all θ_j

$$h_\theta(x^{(i)}) = \frac{1}{1+e^{-\theta^T x}}$$

$$\theta = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \\ \vdots \\ \theta_n \end{bmatrix}$$

using different hypothesis from linear regression
